**General information**

**The shhark® Low Noise Technology**

The standard technology currently used in low noise gear pumps is based on double-flank contact. This solution reduces the peak-to-peak flow pulsation by 75% compared to a single-flank contact gear pumps with the same number of teeth.

The Danfoss shhark® achieves the same reduction of flow pulsation, but in a totally different way. As illustrated below, for the same outer diameter, shhark® gears feature almost twice the number of teeth of a standard gear pump, thanks to a revolutionary asymmetric tooth profile design. Moreover, the shhark® teeth are also slightly helical; the small helix angle does not generate any additional radial and axial load but makes the flow characteristic smoother, further reducing the flow pulsation.

*Standard gear pump (11-teeth) versus shhark® (19-teeth) technology*

The comparison between the flow characteristic of Danfoss SKP2 (11-teeth) and shhark® (19-teeth) is illustrated in the plot below: the reduction of peak-to-peak flow pulsation is 78%. In addition, the average flow per unit width of shhark® is approximately 2.7% higher than SKP2; this means that for the exact same pump dimensions, shhark® delivers more flow.

*Flow characteristics of shhark® vs SKP2 standard*
Features and Benefits

- Noise level emissions reduced up to 10 dB(A)
- Low noise performance guaranteed throughout the whole life of the pump
- Low vibration, flow pulsation reduced by a stunning 78%
- Higher volumetric efficiency than a standard gear pump by 2%
- Wide range of displacements from 6.18 to 29 cm³/rev
- Rated pressure up to 250 bar
- Operating speed up to 4000 rpm
- SAE, DIN and European standard mounting flanges and shafts
- Available with integral relief valve
- Interchangeable with all standard gear pumps
- Multiple pump configurations, available also with standard gear products such as SNP1, SNP2, SKP2 and SNP3
- Compact and lightweight
- Helps to meet legal NVH requirements
- Innovative solution (Danfoss Patents US 20150330387 (A1) and WO2017064046 (A1)
- Ideal for hybrid and full electric machines for which the hydraulic pump is the most important source of noise together with fan drive
- Improved time to market due to elimination of end-of-line noise reduction measures
Advantage of the shhark® versus the "double-flank contact" technology

The effectiveness of double-flank contact is very likely to decrease throughout the pump’s life, because external gear units often work at high pressure with high level of contaminants in the hydraulic fluid. In such conditions, the critical components of the rotating kit slowly wear out, with a progressive loss of the double-flank contact condition and with it, the low noise performance.

shhark® pumps are able to keep low noise performance even after thousands of hours of heavy duty operation in the field, while the dual contact flank pump starts emitting noise in the same conditions due to gears wearing. In addition, shhark® emits noise at lower frequency than the dual contact flank technology, resulting in a more acceptable sound for the human ear.

shhark® Pump Design

In terms of rated operating range (speed, pressure and temperature), overall dimensions and available configurations, the shhark® has been designed to be essentially a low noise version of SKP2 pump.

The 20 mm shaft can accommodate any type of drive end, such as:

• SA (SAE 9-teeth 16/32)
• SB (SAE 11-teeth 16/32)
• RA (SAE 13-teeth 16/32)
• AA (Taper 1:5)
• BA (Taper 1:8)
• GA (Parallel SAE Ø15.875)
• CA (Tang 8x17.8)

As for SKP2, the hydrostatic compensation system is on the bearing blocks to ensure high efficiency, more compact tandem combinations and higher flexibility to distributors.
The table below details the technical data for shhark® gear pumps based on the model and displacement configuration.

### Technical data for SHHP2

</tbody>
</table>

1 kg•m² = 23.68 lb•ft²

**Caution**

The rated and peak pressure mentioned in the table are for pumps with flanged ports only. When threaded ports are required a de-rated performance has to be considered. To verify the compliance of a high pressure application with a threaded ports pump apply to a Danfoss representative.
## General information

### Determination of Nominal Pump Sizes

Generally, the sizing process is initiated by an evaluation of the machine system to perform the necessary work function. The following formulae can be used to determine the nominal pump size for a specific application.

<table>
<thead>
<tr>
<th></th>
<th>Metric System</th>
<th>Inch System</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Output flow</strong></td>
<td>[ Q_e = \frac{V_g \cdot n \cdot \eta_v}{1000} ] (l/min)</td>
<td>[ Q_e = \frac{V_g \cdot n \cdot \eta_v}{231} ] (US gal/min)</td>
</tr>
<tr>
<td><strong>Input torque</strong></td>
<td>[ M_e = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_m} ] (N(m))</td>
<td>[ M_e = \frac{V_g \cdot \Delta p}{2 \cdot \pi \cdot \eta_m} ] (lbf(in))</td>
</tr>
<tr>
<td><strong>Input power</strong></td>
<td>[ P_e = \frac{M_e \cdot n \cdot \pi}{30 000} = \frac{Q_e \cdot \Delta p}{600 \cdot \eta_t} ] (kW)</td>
<td>[ P_e = \frac{M_e \cdot n \cdot \pi}{198 000} = \frac{Q_e \cdot \Delta p}{1714 \cdot \eta_t} ] (hp)</td>
</tr>
</tbody>
</table>

**Variables:**
- \( V_g = \text{Displacement per rev.} \)
- \( p_H \) = High pressure
- \( p_L \) = Low pressure
- \( \Delta p = p_H - p_L \)
- \( n = \text{Input speed} \)
- \( \eta_v = \text{Volumetric efficiency} \)
- \( \eta_m = \text{Mechanical (torque) efficiency} \)
- \( \eta_t = \text{Overall efficiency} (\eta_v \cdot \eta_m) \)

**SI units [US units]:**
- cm\(^3\)/rev [in\(^3\)/rev]
- bar [psi]
- bar [psi]
- min\(^{-1}\) (rpm)

System Requirements

Inlet Pressure

**Peak pressure** is the highest intermittent pressure allowed at the pump’s outlet. Peak pressure depends on the relief valve overshoot (reaction time).

**Rated pressure** is the maximum continuous operating pressure. The maximum machine load demand determines rated pressure.

**Inlet Vacuum** must be controlled in order to preserve pump’s expected life and performance. The system design must meet inlet pressure requirements during all operation modes. Expected lower inlet pressures during cold start will be improved as soon as the fluid warms up.

<table>
<thead>
<tr>
<th>Max. continuous inlet vacuum</th>
<th>Maximum pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.7 bar absolute [20.7 in. Hg]</td>
<td>4.0 bar absolute [118.1 in. Hg]</td>
</tr>
</tbody>
</table>

The illustration below shows peak pressure in relation to rated pressure and reaction time (100 ms maximum).
System Requirements

Speed

**Maximum speed** is the limit recommended by Danfoss for a particular gear pump when operating at rated pressure. It is the highest speed at which normal life can be expected.

**Minimum speed** is the lowest operating speed limit at which normal life can be expected. The minimum speed increases according to operating pressure increase.

When operating at higher pressures, a higher minimum speed must be maintained, see below:

Speed versus pressure

---

Operating Envelope

---

Operating envelope legend:

- **N₁** Minimum speed at 100 bar
- **N₂** Minimum speed at 180 bar
- **N₃** Minimum speed at rated pressure

---

Hydraulic Fluids

Ratings and data for shhark® gear pumps are guaranteed when the hydraulic system operates with premium hydraulic fluids without containing oxidation, rust, or foam inhibitors.

These fluids have to work with good thermal and hydrolytic stability to prevent wear, erosion, or corrosion of internal components. They include:

- Hydraulic fluids following DIN 51524, part 2 (HLP) and part 3 (HVLP) specifications
- API CD engine oils conforming to SAE J183
- M2C33F or G automatic transmission fluids
- Certain agricultural tractor fluids

---

**Caution**

Use only clean fluid in the gear pumps and hydraulic circuit. Never mix hydraulic fluids.
System Requirements

Temperature and Viscosity

Temperature and viscosity requirements must be concurrently met. Use of petroleum/mineral-based fluids is highly recommended.

High temperature limits apply at the inlet port of the pumps. The pumps should run at or below the maximum continuous temperature.

Minimum (cold start) temperature relates to the physical properties of component materials.

Maximum continuous temperature allowed at which normal life can be expected.

Peak (intermittent) temperature is the overheating temperature that is tolerable by the machine for a transient/limited time.

Cold oil, generally, doesn’t affect the durability of pumps components. It may affect the ability of oil to flow and transmit power. For this reason, keep the temperature at 16°C [60 °F] above the pour point of the hydraulic fluid.

Temperature limits

<table>
<thead>
<tr>
<th>Minimum (cold start)</th>
<th>Maximum continuous</th>
<th>Peak (intermittent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-20°C (-4°F)</td>
<td>95°C [203°F]</td>
<td>110°C [230°F]</td>
</tr>
</tbody>
</table>

Minimum viscosity occurs only during brief occasions of maximum ambient temperature and severe duty cycle operation. It’s the minimum acceptable viscosity to allow normal motor life.

Maximum viscosity occurs only during cold start at very low ambient temperatures. It’s the upper limit of viscosity that allows the motor to start.

- Size heat exchangers to keep the fluid within these limits
- Test regularly to verify that these temperatures and viscosity limits aren’t exceeded
- Keep the fluid viscosity in the recommended viscosity range for maximum unit efficiency and bearing life

</thead>
</table>
Filtration

Filters
Use a filter that conforms to Class 22/18/13 of ISO 4406 (or better). It may be on the outlet (pressure filtration) or inlet (return line filtration).

Selecting a filter
When selecting a filter, please consider:
• Contaminant ingression rate (determined by factors such as the number of actuators used in the system)
• Generation of contaminants in the system
• Required fluid cleanliness
• Desired maintenance interval
• Filtration requirements of other system components

Measure filter efficiency with a Beta ratio ($\beta_x$). $\beta_x$ ratio is a measure of filter efficiency defined by ISO 4572. It is the ratio of the number of particles greater than a given diameter (in microns) upstream of the filter to the number of these particles downstream of the filter.
• For suction filtration with controlled reservoir ingestion, use a $\beta_{35-45} = 75$ filter
• For pressure or return filtration, use a filtration with an efficiency of $\beta_{10} = 75$

The filtration requirements for each system are unique. Evaluate filtration system capacity by monitoring and testing prototypes.

Fluid cleanliness level and $\beta_x$ ratio

| Fluid cleanliness level (per ISO 4406)          | Class 22/18/13 or better |
| $\beta_x$ ratio (suction filtration)          | $\beta_{35-45} = 75$ and $\beta_{10} = 2$ |
| $\beta_x$ ratio (pressure or return filtration) | $\beta_{10} = 75$ |
| Recommended inlet screen size                 | 100 – 125 μm [0.004 – 0.005 in] |

Reservoir
The reservoir provides clean fluid, dissipates heat, removes entrained air, and allows fluid volume changes associated with fluid expansion and cylinder differential volumes. A correctly sized reservoir accommodates maximum volume changes during all system operating modes. It promotes de-aeration of the fluid as it passes through, and accommodates a fluid dwell-time between 60 and 180 seconds, allowing entrained air to escape.

Minimum reservoir capacity depends on the volume required to cool and hold the oil from all retracted cylinders, allowing for expansion due to temperature changes. A fluid volume of 1 to 3 times the pump output flow (per minute) is satisfactory. The minimum reservoir capacity is 125% of the fluid volume.

Install the suction line above the bottom of the reservoir to take advantage of gravity separation and prevent large foreign particles from entering the line. Cover the line with a 100-125 micron screen. The pump should be below the lowest expected fluid level.

Put the return-line below the lowest expected fluid level to allow discharge into the reservoir for maximum dwell and efficient deaeration. A baffle (or baffles) between the return and suction lines promotes deaeration and reduces fluid surges.
System Requirements

Line sizing

Choose pipe sizes that accommodate minimum fluid velocity to reduce system noise, pressure drops, and overheating. This maximizes system life and performance.

Design inlet piping that maintains continuous pump inlet pressure above 0.8 bar absolute during normal operation. The line velocity should not exceed the values in the table below:

<table>
<thead>
<tr>
<th>Maximum line speed</th>
<th>Inlet</th>
<th>Outlet</th>
<th>Return</th>
</tr>
</thead>
<tbody>
<tr>
<td>m/s [ft/sec]</td>
<td>5 [16.4]</td>
<td>2.5 [8.2]</td>
<td>3 [9.8]</td>
</tr>
</tbody>
</table>

Most systems use hydraulic oil containing 10% dissolved air by volume. Under inlet vacuum conditions the oil releases the dissolved air. Moreover, when inlet vacuum is particularly severe, the hydraulic fluid may cavitate, causing adjacent metal surfaces to erode.

⚠️ Warning

Over-aeration is the result of air leaks on the inlet side of the pump, and flow-line restrictions. This problem will not occur if inlet vacuum and rated speed requirements are maintained, reservoir size and location are adequate, adequate pipes size is used, avoiding sharp bends, or elbow fittings causing a reduction of flow line cross-sectional area.

Pump Drive

Shaft options for shhark® Group 2 gear pump include tapered, tang, splined, or parallel shafts. They are suitable for a wide range of direct and indirect drive applications for radial and thrust loads.

Plug-in drives, acceptable only with a splined shaft, can impose severe radial loads when the mating spline is rigidly supported. Increasing spline clearance does not alleviate this condition. Use plug-in drives if the concentricity between the mating spline and pilot diameter is within 0.1 mm [0.004 in]. Lubricate the drive by flooding it with oil. A 3-piece coupling minimizes radial or thrust shaft loads.

Pilot cavity

In order to avoid spline shaft damages it is recommended to use carburized and hardened steel couplings with 80-82 HRA surface hardness.

Allowable radial shaft loads are a function of the load position, load orientation, and operating pressure of the hydraulic pump. All external shaft loads have an effect on bearing life, and may affect pump performance.

In applications where external shaft loads can’t be avoided, minimize the impact on the pump by optimizing the orientation and magnitude of the load. Use a tapered input shaft; don’t use splined shafts for belt or gear drive applications. A spring-loaded belt tension-device is recommended for belt drive applications to avoid excessive tension. Avoid thrust loads in either direction. Contact Danfoss if continuously applied external radial or thrust loads occur.
System Requirements

Pump Life

Pump life is a function of speed, system pressure, and other system parameters (such as fluid quality and cleanliness).

All Danfoss gear pumps use hydrodynamic journal bearings that have an oil film maintained between the gear/shaft and bearing surfaces at all times. If the oil film is sufficiently sustained through proper system maintenance and operating within recommended limits, long life can be expected.

The B_{10} life expectancy number is generally associated with rolling element bearings. It does not exist for hydrodynamic bearings.

High pressure, resulting from high loads, impacts pump life. When submitting an application for review, provide machine duty cycle data that includes percentages of time at various loads and speeds. We strongly recommend a prototype testing program to verify operating parameters and their impact on life expectancy before finalizing any system design.

Sound Level

Fluid power systems are inherent generators of noise. As with many high power density devices, noise is an unwanted side effect.

However, there are many techniques available to minimize noise associated with fluid power systems. To apply these methods effectively, it is necessary to understand how the noise is generated and how it reaches the listener. The noise energy can be transmitted away from its source as either fluid borne noise (pressure ripple) or as structure borne noise.

Pressure ripple is the result of the number of pumping elements (gear teeth) delivering oil to the outlet and the pump’s ability to gradually change the volume of each pumping element from high to low pressure. In addition, the pressure ripple is affected by the compressibility of the oil as each pumping element discharges into the outlet of the pump. Pressure pulsations will travel along the hydraulic lines at the speed of sound (about 1400 m/s in oil) until affected by a change in the system such as an elbow fitting. Thus the pressure pulsation amplitude varies with overall line length and position.

Structure borne noise may be transmitted wherever the pump casing is connected to the rest of the system. The response of one circuit component to excitation depends on its size, form, and manner in which it is mounted or supported. Because of this excitation, a system line may actually have a greater noise level than the pump. To reduce this excitation, use flexible hoses in place of steel plumbing. If steel plumbing must be used, clamping of lines is recommended. To minimize other structure borne noise, use flexible (rubber) mounts.

Contact your Danfoss representative for assistance with system noise control.
Sound Level Graphs

The sound level graphs show typical sound pressure levels for SHHP2NN and SKP2NN pumps (with SAE A flange and spline shaft) expressed in dB(A) at 1 m [3.28 ft] from the unit.

Data were taken using ISO VG46 petroleum /mineral based fluid at 50°C (viscosity at 28 mm²/s [cSt]).
These values are only comparative numbers, since they are obtained in test lab, not in an anechoic chamber.

Other shaft options may exist. Contact your Danfoss representative for availability.

⚠️ Caution

Shaft torque capability may limit allowable pressure. Torque ratings assume no external radial loading. Applied torque must not exceed these limits, regardless of stated pressure parameters. Maximum torque ratings are based on shaft torsional fatigue strength.

The second section torque limit is equal to 70 N-m. Other configuration with higher rated torque are available upon request.
Product Options

Pumps with integral relief valve - SHHP2EN and SHHP2IN

Group 2 pumps are offered with an optional integral relief valve in the rear cover. This valve can have an internal (SHHP2IN) or external (SHHP2EN) drain.

This valve opens directing all flow from the pump outlet to the internal or external drain when the pressure at the outlet reaches the valve setting. This valve can be ordered preset to the pressures shown in the table below. Valve performance curve, rear cover cross-section and schematics are shown below.

Integral relief valve performance graph

![Integral relief valve performance graph](image)

Integral relief valve cross-section

![Integral relief valve cross-section](image)

1. Inlet
2. Drain

Caution

When the relief valve is operating in bypass condition, rapid heat generation occurs. If this bypass condition continues, the pump prematurely fails. The reason for this is that it is a rule, not an exception. When frequent operation is required, external drain option (SHHP2EN) must be used.

Danfoss Power Solutions is a global manufacturer and supplier of high-quality hydraulic and electric components. We specialize in providing state-of-the-art technology and solutions that excel in the harsh operating conditions of the mobile off-highway market as well as the marine sector. Building on our extensive applications expertise, we work closely with you to ensure exceptional performance for a broad range of applications. We help you and other customers around the world speed up system development, reduce costs and bring vehicles and vessels to market faster.

Danfoss Power Solutions – your strongest partner in mobile hydraulics and mobile electrification.

Go to www.danfoss.com for further product information.

We offer you expert worldwide support for ensuring the best possible solutions for outstanding performance. And with an extensive network of Global Service Partners, we also provide you with comprehensive global service for all of our components.

Products we offer:
- DCV directional control valves
- Electric converters
- Electric machines
- Electric motors
- Gear motors
- Gear pumps
- Hydrostatic motors
- Hydrostatic pumps
- Orbital motors
- PLUS+1® controllers
- PLUS+1® displays
- PLUS+1® joysticks and pedals
- PLUS+1® operator interfaces
- PLUS+1® sensors
- PLUS+1® software
- PLUS+1® software services, support and training
- Position controls and sensors
- PVG proportional valves
- Steering components and systems
- Telematics
