# 1. GENERAL

## 1.1 INTENDED USE

This document covers the following filter types:

- RFI - filters on the input side, and
- dU/dt - filters and sine - filters on the output side of the VACON® NX AC drive.

## 1.2 SAFETY NOTICE

**WARNING:** All internal components and component boards, with the exception of the galvanically separated input and output terminals are connected to high voltage when the AC drive is connected to the mains. It is extremely dangerous to touch these live parts. Touch may cause severe injury or death.

### NOTE!

The I/O terminals are separated from the high potential of the mains, but the relay outputs and other I/O terminals may carry high voltages even if the AC drive is not connected to the mains.

### NOTE!

Do not perform any high pot tests (megger) on the filters. The VACON® RFI filters are intended for use in grounded supplies only. For ungrounded (IT) supplies, contact our representative or us.

### General safety instructions

**WARNING:** Installation and service work only by qualified electricians.

**WARNING:** No work on an operating unit. Contact with the electrical parts may be fatal, even after disconnection from the power network.

**WARNING:** To avoid electrical shock hazard:

- Before servicing the unit, wait at least the voltage discharge time stated in the user guide for the corresponding AC drive.
- Dangerous voltage may be on the unit even when the motor is not rotating.

**WARNING:** Never attempt to repair a defective unit.

**WARNING:** The unit surface temperature rises during operation. Avoid any contact.

## Grounding

**WARNING:** The unit must be grounded before switching the power on.  
Please refer to the data sheet for detailed information.

## Screening

It is recommended to use shielded cables to reduce noise, electromagnetic interference and to prevent malfunctions in the installation.

Preferably:

- Screened and/or twisted cable between the converter output and unit input (U1, V1, W1).
- Shielded cables between the unit output (U2, V2, W2) and the motor.
- In case of unscreened cables it should be ensured that the installation minimizes the possibility of cross-couplings with other cables which are carrying sensitive signals. This can be achieved by measures such as cable segregation and mounting in earthed cable trays.

## 1.3 GENERAL

AC drives do not supply a smoothly changing AC voltage to the motor, but a pulsed DC voltage. The sum of the three phase voltages does not sum to zero, as in the case of mains supply, leading to the presence of a common-mode voltage between the motor coils and ground.

The pulses fed to the motor have very steep flanks, and the rate of voltage change ( $dU/dt$ ) may reach several  $kV/\mu s$ . Unloaded IGBTs will switch at speeds of about 6 - 8  $kV/\mu s$ , when a motor cable and motor is connected, and the speed will drop to about 2  $kV/\mu s$ . The voltages caused by these steep pulses may be dangerous to the insulation of the motor.

The high switching speeds give rise to EMC effects, both as radiated disturbances as well as disturbance currents in galvanically connected cables. The radiated interference is usually grounded by the metallic enclosure of the drive as well as through the use of shielded cable, and does not cause any problems in the environment. The galvanically coupled interference may have to be filtered in order to achieve EMC compliance. The VACON® NX range of AC drives contain an internal filter for bringing the drives into compliance with the standard (specifically IEC 61800-3:2004). In some cases, additional filtering is required. Both input and output filters are available for the VACON® NX range of drives. The drive may also have to be protected against various overvoltages occurring in the supply. On the input side RFI filters and additional chokes can be installed, on the output side  $dU/dt$  filters or sine filters.

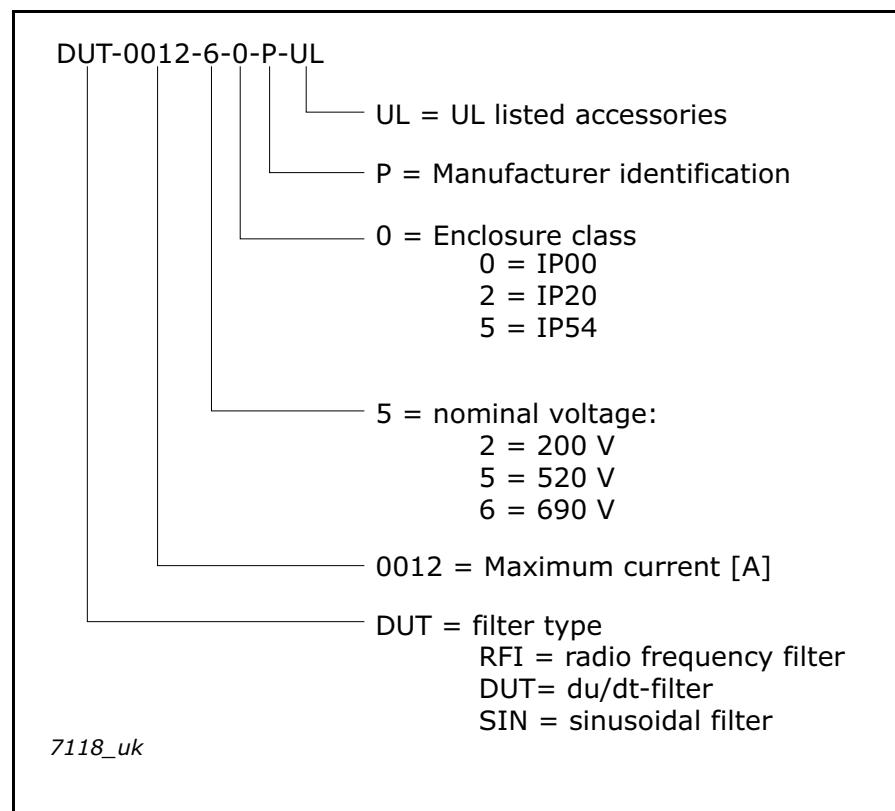

**1.4 TYPE CODE**

Figure 1. Type code for VACON® NX filters

## 2. FILTER TYPES

### 2.1 RFI-FILTERS

#### 2.1.1 GENERAL

Table 1 shows the filters used to make the VACON® NX range of AC drives comply with EN/IEC 61800-3 for the domestic and industrial environment, in case the basic drive does not comply. All enclosure sizes 4 - 9 comply with the requirements of EN/IEC 61800-3, ed 2 for the categories 1 and 2, the 690 V versions for category 3. The common DC bus system components and drives which have rated current higher than 400 A are designed to category 4. Therefore the basic modules do not have any specific compliance, but the whole installation has to be designed to comply with the requirements.

The stand - alone and VACON® NXC solutions comply with category 3 requirements.

#### Definitions:

##### First environment

Environment that includes domestic premises and establishments directly connected without intermediate transformers to a low-voltage power supply network, which supplies buildings used for domestic purposes.

**NOTE!** Houses, apartments, commercial premises or offices in a residential building are typical examples of the first environment location.

##### Second environment

Environment that includes all establishments other than those directly connected to a low voltage power supply network, which supplies buildings used for domestic purposes.

**NOTE!** Industrial areas, technical areas of any building fed from a dedicated transformer are typical examples of the second environment locations (IEC 923/04).

*EMC designation C =>* fulfils the requirements of category 1: PDS (power drive system (AC drive plus motor)) of rated voltage less than 1000 V, intended for use in the first environment.

*EMC designation H =>* fulfils the requirements of category 2: PDS of rated voltage less than 1000 V, which is neither a plug-in device nor a movable device and, when used in the first environment, is intended to be installed and commissioned only by a professional.

**NOTE!** A professional is a person or an organization having necessary skills in installing and/or commissioning power drive systems, including their EMC aspects.

*EMC designation L =>* fulfils the requirements of category 3: PDS of rated voltage less than 1000 V, intended for use in the second environment and not intended for use in the first environment.

*EMC designation N =>* fulfils the requirements of category 4: PDS of rated voltage equal to or above 1000 V, or rated current equal to or above 400 A, or intended for use in complex systems in the second environment.

**NOTE!** In this case the compliance has to be verified case by case.

The filters must be correctly installed and grounded.

There are no standards at present for IT supplies (floating supplies) - the EMC code T shows that the drives and drive modules have very small ground capacitance making them suitable for use on IT supplies. The small capacitance is required as larger values would cause the installed ground circuit monitoring circuits to fail. We recommend the use of monitors manufactured by Bender.

The VACON® NX AC drives comply with the immunity requirements EN/IEC 61800-3; 2004, second environment as standard.

Note that the filters RFI-0012-5-IP54 to RFI-0105-5-IP54 are designed to fit mechanically directly to the corresponding drive. All others are loose and must be connected to the drive separately.

### 2.1.2 RFI FILTER TYPES

*Table 1. RFI footprint filters for drive enclosure sizes 4-7*

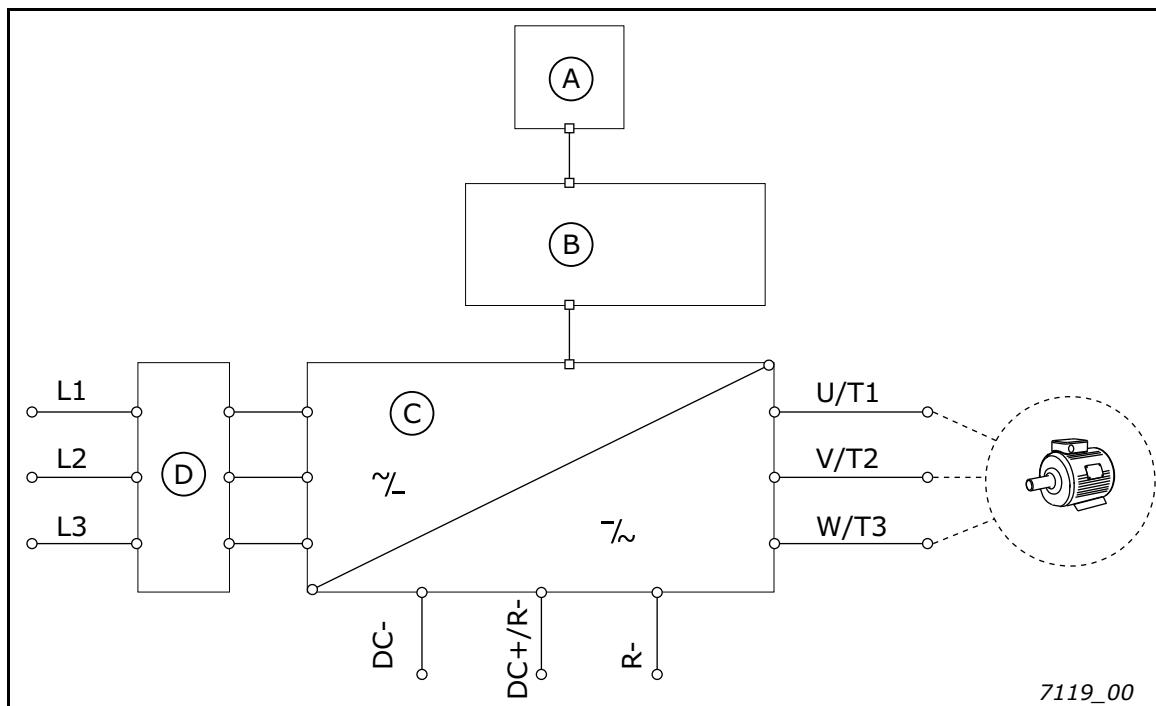

Filter type code	Drawing number	Manufacturer's part code	Rated voltage, 3~, 50-60 Hz [V AC]	Nominal current at 50°C [A]	Dimensions W x H x D [mm]	W[kg]	IP class
RFI-0012-5-IP54	70CTC1100857	FS32821-16-99	520	16	128 x 395 x 61.5	2.8	IP54
RFI-0031-5-IP54	70CTC1100865	FS32821-42-99	520	42	144 x 490 x 61.5	4.4	IP54
RFI-0061-5-IP54	70CTC1100869	FS32821-75-99	520	75	195 x 625 x 90	8.2	IP54
RFI-0105-5-IP54	70CTC1100887	FS32821-130-99	520	130	230 x 745 x 100	15.5	IP54

### Suitability

#### Dimension data

Detailed dimension drawings in Chapter 3.1.

### 2.1.3 EXTERNAL RFI FILTER TYPES

The external filters must be mounted close to the input of the drive or drive system. Note that the cable layout must be such, that the maximum physical separation exists between the filter input and output cables. Otherwise the effect of the filter could be negated.

*Table 3. External RFI filter types*

Filter type code	Manufacturer's part code	Rated voltage, 3~, 50-60 Hz [V AC]	Nominal current at 50°C [A]	Nominal current at 40°C [A]	Power loss [W]	IP class

NX_0460-0590 5	RFI-0600-5-0		
NX_0650-0920 5	RFI-1000-5-0		

**Installation recommendations:**

The motor cable must be kept as short as possible both inside and outside the enclosure. This means that the optimum location for the drive is close to the driven motor in wall mounted units or close to the cable conduit hole in enclosed units.

Separate the supply cable and the motor cable by at least 20 cm (8 in). If it is not possible to achieve spatial separation, use a separator shield, which must be solidly and multiply grounded. The cable from the filter to the drive must be shielded. The grounding must be done through a large area.

If several drives are used, check if it is feasible to use one common filter for all drives. In that case, additional filtering of the drives is unnecessary. The cable between the filter and the drives should be kept as short as possible. This usually means, that the drives and filter are mounted adjacent to one another.

Ground the filter over a large surface to the mounting plate or the back of the enclosure. If the plate is varnished, remove the varnish to ensure a good electrical connection at the screw locations.

All metal parts of the enclosure must be connected to one another with low impedance, large area cables. The door must be grounded through short flexible leads to the frame of the enclosure

Cross the cables at the right angle (90°)

Connect all unused poles of all cables to the ground

## 2.2 D<sub>U</sub>/d<sub>T</sub> FILTERS

### 2.2.1 GENERAL

The VACON® NX drives use IGBT transistors as an output element. These semiconductors create the correct voltage to the motor switching it at very high speed (4 - 6 kV/s) with an unloaded IGBT. This high speed will, under certain circumstances, cause extra voltage stress on the main insulation of the motor.

Usually there are no problems with motors designed for a 400 V supply. Such motors are usually designed for a voltage level of 1200 V, which exceeds the AC drive induced stress.

In 500 V supplies the motor has to withstand at least 1600 V. A dU/dt filter is often required with these motors in order not to exceed the allowable voltage stress. In 690 V supplies the motor has to withstand at least 1800 V, and a dU/dt filter is required in these cases.

**NOTE!** In uncertain cases, confirm the rating of the motor in AC drive application with the motor manufacturer.

**NOTE!** Set the switching frequency parameter to correspond to the value printed on the nameplate of the filter and the output voltage level. Do not increase the switching frequency above the rated value of the filter. Decreasing it below is allowed.

The high switching speed (about 2 kV/s) with the motor and cable connected, creates a travelling wave in the cable. The speed of this wave is set by the cable's wave impedance, usually about 50 - 100 Ω. This is less than the motor's wave impedance, which is on the order of 1 kΩ. As the travelling voltage wave hits this discontinuity, it is reflected back, increasing the instantaneous voltage on the motor winding. The wave is reflected back and forth between motor and drive and finally the steady state voltage is reached.

### Winding voltage stresses

The rapid change in voltage is not distributed equally over all windings, but the first windings show higher voltage stresses than the inner ones, due to the capacitive coupling between the windings. Modern motors can withstand a voltage rise times of < 2 kV/μs. In case of doubt, use a dU/dt filter or contact the motor manufacturer.

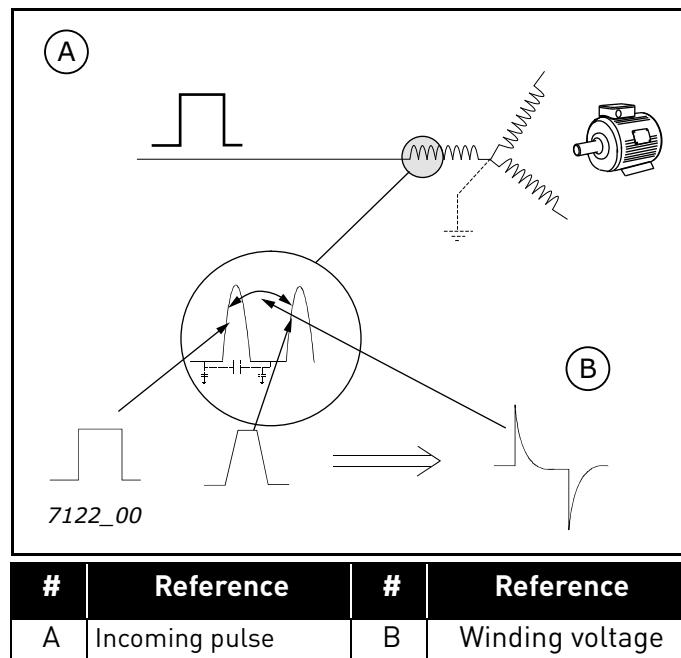

Figure 5. Change of the voltage shape in winding

## Voltage stress

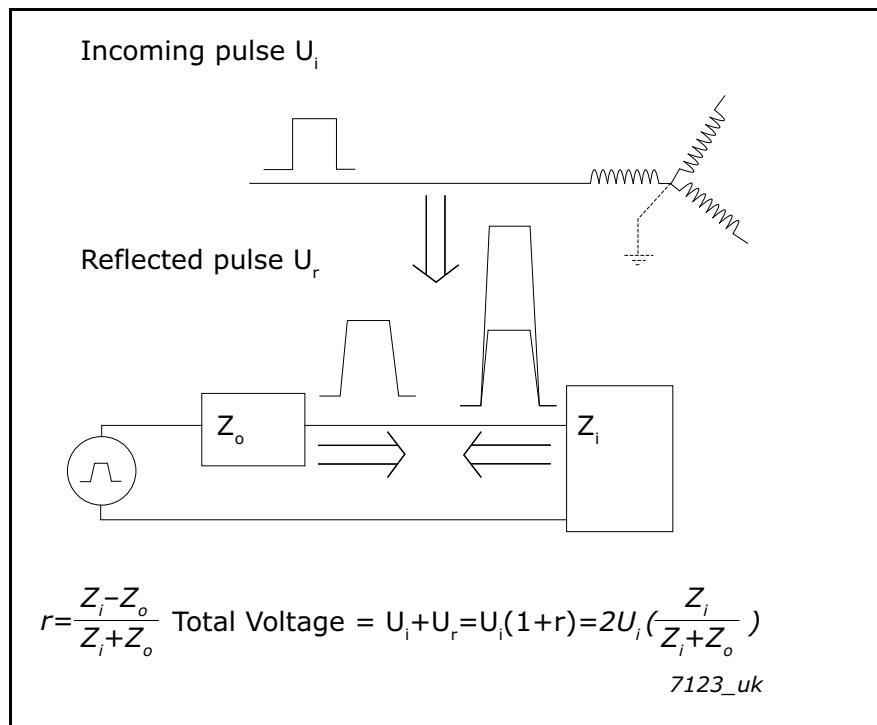

Figure 6. Voltage pulse reflection

The reflected voltage maximum value is  $2 \times$  DC-link voltage, in practice  $1.8 \dots 1.9 \times U_{DC}$ . The voltage is fully developed at cable lengths  $> 5$  m.

Note that the DC-link voltage is increased if the supply is high or if an active front end maintains a high DC-link voltage or if the drive is in a regenerative (braking) mode. If this voltage stress is too high, it is recommended to use the dU/dt filters.

A dU/dt filter is an undammed serial LC filter, with a resonance frequency of about 120 kHz - this will limit the voltage rise speed to  $< 1000$  V/ $\mu$ s. If lower speeds are required, the capacitance can be increased.

The filter, cable and motor form a complex high frequency circuit, which causes a voltage at the motor with different rise times and peak values depending on the cable length, type, etc.

Typical values as a function of cable length are as follows:

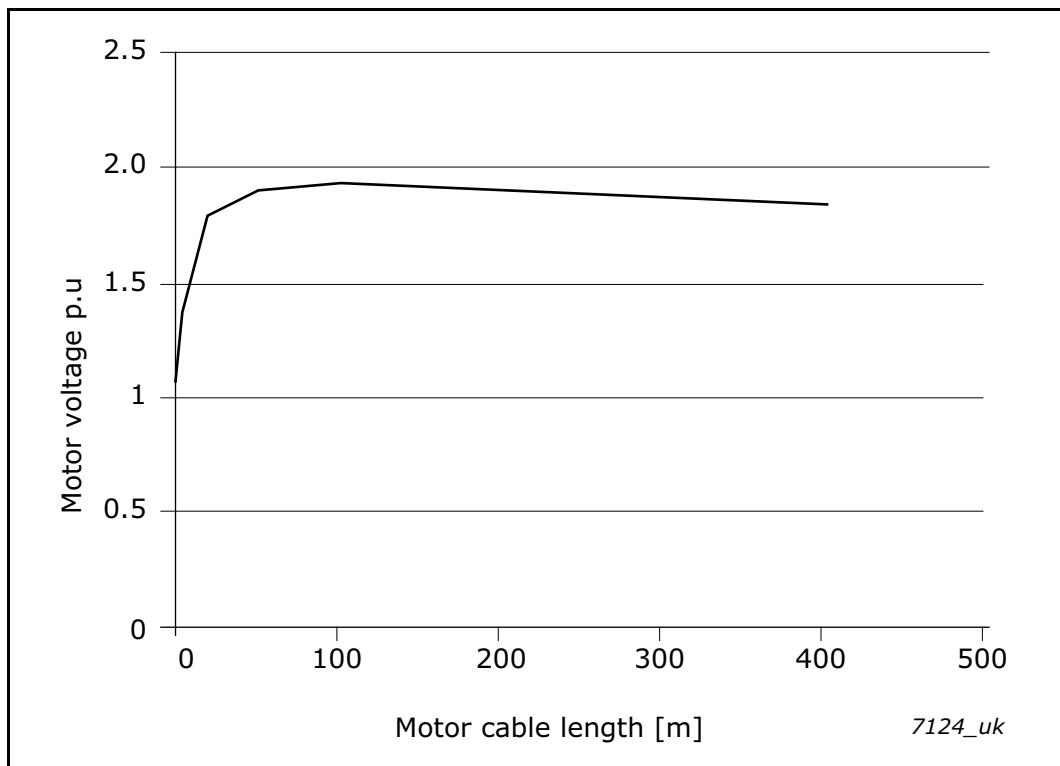

Figure 7. Typical motor voltage p.u. as a function of motor cable length (m)

Due to the inductance in series with the load there is a voltage drop across the dU/dt filter, decreasing the voltage available for the motor. At full rated current this drop is about 5 V.

Filters are chosen so that their rated current > drive rated current. They will thermally withstand the same overload specifications as the drive. For VACON® NX there is only one range of filters, suitable for the voltage range from 380 to 690 V. The filters can also be used at lower voltages, if required.

**NOTE!** The dU/dt filters are designed for a switching frequency of 1.5 kHz for 690 V AC and 3.6 kHz for 500 V AC voltage level. DO NOT EXCEED THIS VALUE, as there is a risk of overheating. Using lower switching frequencies is not a problem.

**NOTE!** The dU/dt filters are designed for the maximum output frequency of 70 Hz. If this value is exceeded there is a risk of overheating. If higher output frequency is requested then the drive output current is needed to decrease. Motor frequency de-rating for different filter types is shown in Chapter 3.4.

**Recommendations:**

Figure 8, Table 7 and Table 8 show the filter and motor requirements based on the nominal voltage level and IEC & NEMA motor standards.

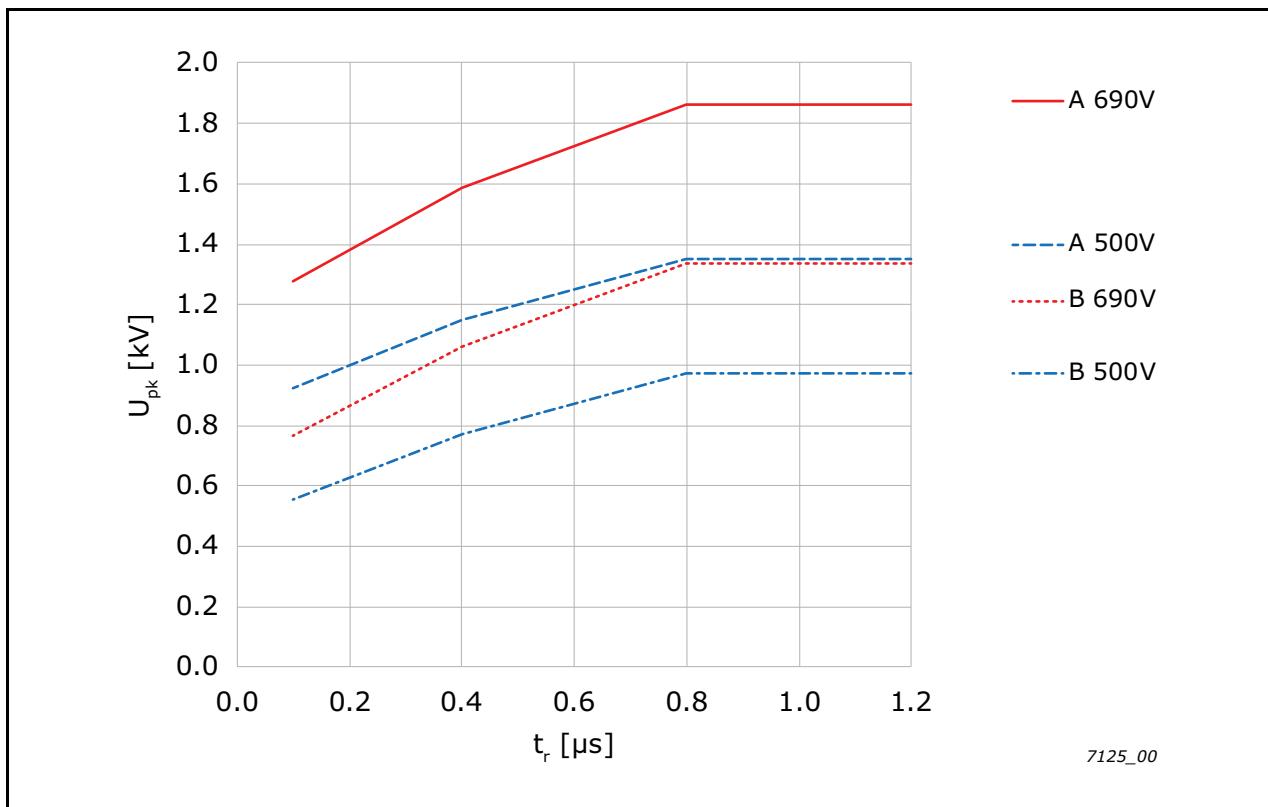

Figure 8. IEC 60034-25-ed3: Limiting curves of impulse voltage  $U_{pk}$  as a function of the peak rise time  $t_r$ , measured between two motor phase terminals.

- Curve A 500/690 V = Typical electrical machines
- Curve B 500/690 V = Electrical machines with older insulation system

Table 7. Recommendations of  $dU/dt$  usage based on the voltage class and motor insulation system

Nominal voltage $U_n$	Filters and motor isolation requirements
$U_n \leq 420$ V	No filters required if the motor insulation is according to curve A 500 V - IEC60034-25
$420$ V $\leq U_n \leq 500$ V	$dU/dt$ filter is needed for motor insulation according to curve A 500 V - IEC60034-25 or No filters required if the motor insulation is according to curve A 690 V - IEC60034-25
$500$ V $\leq U_n \leq 690$ V	$dU/dt$ filter is needed for motor insulation according to curve A 690 V - IEC60034-25 or No filter if motor is wound with medium voltage technology - form wound

Table 8. Recommendations of  $dU/dt$  usage based on the voltage class and NEMA motor insulation system, NEMA MG1, Part 31

For motors with $U_n \geq 600$ V	$U_{peak} = 3.1 \times U_n$
For motors with $U_n < 600$ V	$U_{peak} = 2.04 \times U_n$

## 2.2.2 dU/dt FILTER TYPES

The available IP ratings are IP00, IP21 and IP54.

Table 9. dU/dt-filter types

Filter type code	Manufacturer's part code	Rated voltage, 3~ [V AC]	Nominal current at 40°C [A]	Nominal current at 50°C [A]	Power loss at 40°C [W]	IP class

### 2.2.3 INSTALLATION

The connection of the dU/dt and sine filters is shown in the figure below.

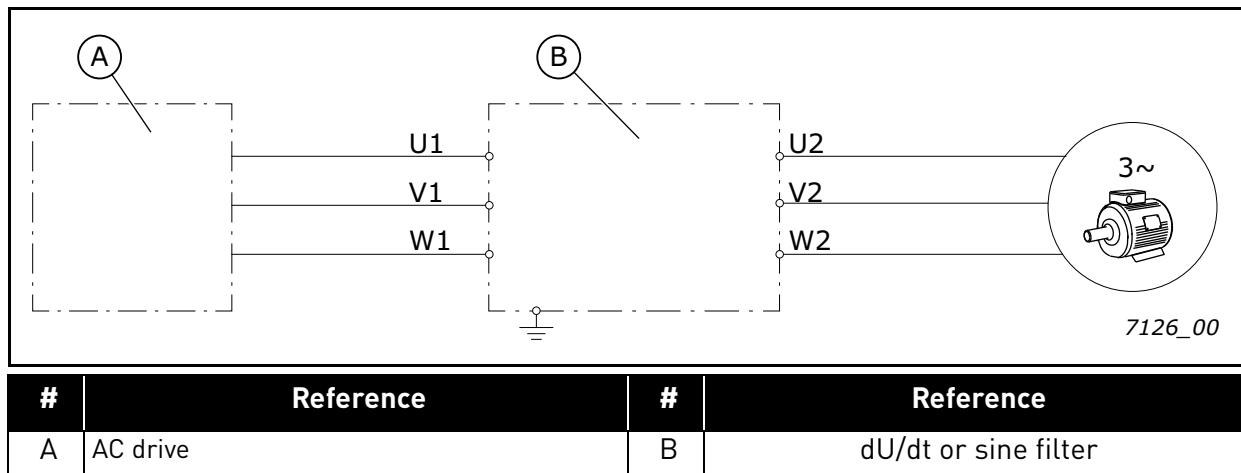

Figure 9. Filter connection

**NOTE!** The maximum motor cable length for P-type dU/dt-filter is 100 m. In case of multiple cables, the length is defined as a total length of the cables. Cabling capacitance and the switching current grow as a cable length function. Therefore there is a risk of filter overheating, when long cabling lengths are used. If the cable length is not sufficient enough, it is recommended to use a filter one size larger or sine filters.

S-type dU/dt filters safe operation area as a function of the switching frequency of the drive and motor cable length is shown in Chapter 3.3. Note that diagrams show values based on pre-defined cable capacitance. The values should be scaled in accordance with the actual capacitance of the cable. In case of multiple cables the capacitance is defined as a sum of the cable capacitances.

**NOTE!** Cooling of P-type dU/dt filters is based on natural air convection (AN). Therefore, proper ventilation and placement inside the enclosure must be ensured during assembly. Suitability for base or wall mounting is show in Table 17.

The S- type dU/dt filters are forced air cooled and require a 220 V AC power supply for their fans. The filter has a build-in thermal switch, which indicates if the filter temperature has exceeded the safe limits. This NC contact can be wired to the External fault input of the drive - see the wiring schematic in Figure 10.

Check the input parameterization from the relevant drive application manual. If the external fault input is used for other purposes, you can also connect the fault contact in series with the RUN or the RUN ENABLE command - for their terminal assignment see the relevant application manual.

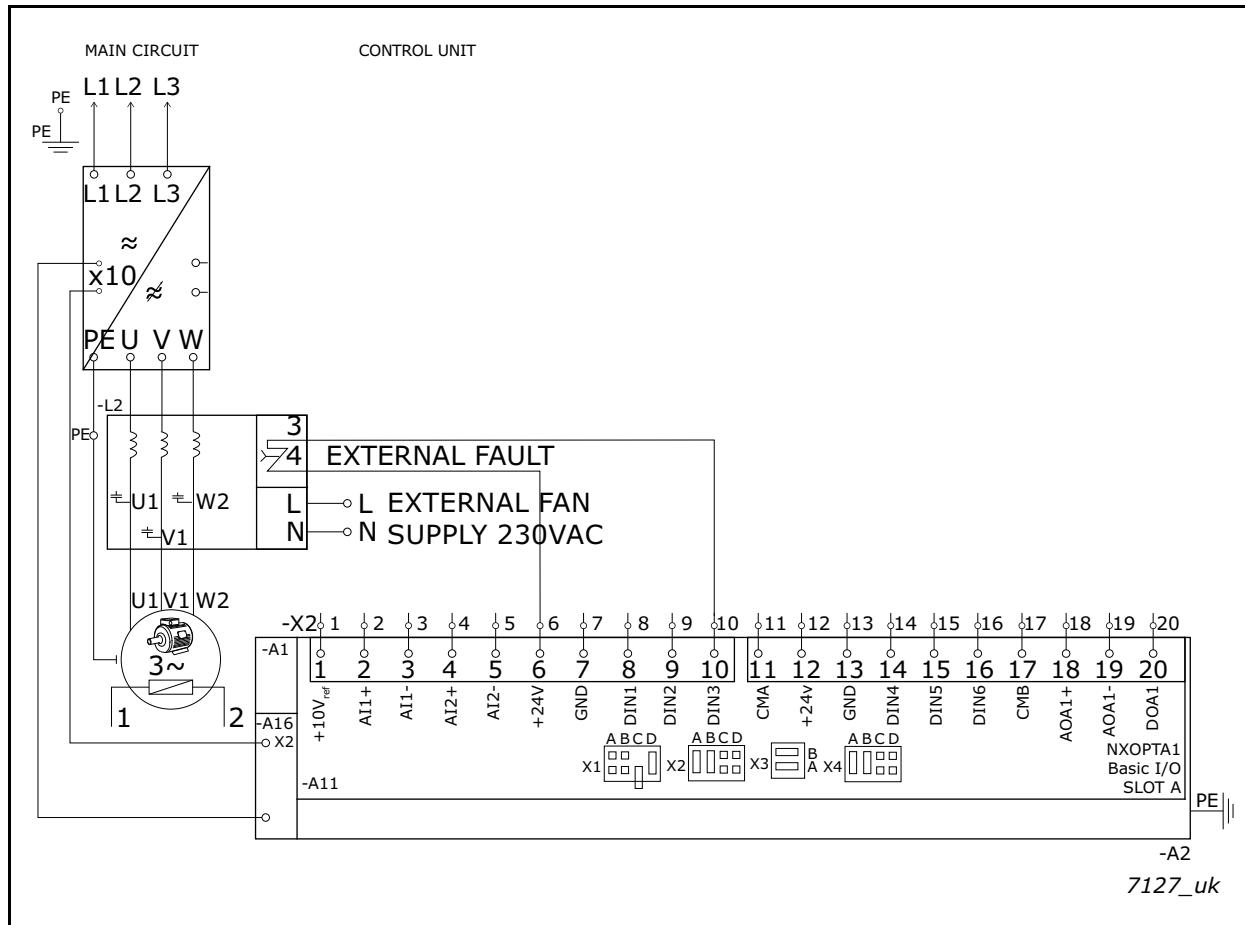

Figure 10. Wiring schematic of the S-type dU/dt filter external fan supply and thermal supervision NC connection

There are enclosure restrictions and details for selection and mounting when using UL listed accessories, IP00 dU/dt-filter models. These restrictions and details should be noted during the filter assembly. For details of drive selection and enclosure restrictions, see Table 15.

- Suitable for use on a circuit capable of delivering not more than 100 000 rms symmetrical amperes, 600 V maximum, or equivalent.
- Use 60/75 C CU wire only or equivalent copper/aluminum busbars.
- Tightening torque and wire range for field wiring terminals are mentioned in the manual or on the wiring diagram.

## 2.3 SINE FILTERS

### 2.3.1 GENERAL

If the motor cannot withstand any additional voltage stresses, or the dU/dt filter does not decrease them sufficiently, a sine filter can be used. The sine filter is also an LC filter, but with resonance frequency < 50% of the switching frequency, i.e. about 600 Hz for the 690 V drives and about 1.2 kHz for the 500 V drives. Hence there are two different ranges. The filter removes the carrier frequency, leaving only the output frequency and thus eliminating all voltage stress on the motor.

At full load the voltage drop is about 30 V - a significant part of the available voltage. This has to be taken into account when the motor sizing is done. The voltage drop can be partly compensated by decreasing the field weakening point level; feeding the motor the correct voltage up to this point, but the motor will not receive full voltage at nominal speed. The voltage drop can also be compensated by using an active front end drive, increasing the DC-link voltage.

**NOTE!** The sine filters are designed for a switching frequency of 1.5 kHz for 690 V AC and 3.6 kHz for 500 V AC, which corresponds to the nominal switching frequency of VACON® NX drives. It is safe to increase the switching frequency, but IT IS NOT ALLOWED TO DECREASE THIS VALUE below nominal, as there is a risk of overheating.

The VACON® NX drive has a switching frequency foldback feature on overtemperature for the drive. This has to be disabled for 500 V drives when sine filters are used. See the drive application manual.

**NOTE!** The sine filters are designed for a maximum output frequency of 70 Hz. If this value is exceeded there is a risk of overheating. If higher output frequency is requested, the drive output current must be decreased. De-rating for motor frequency for different filter types is shown in Chapter 3.4.

The filters are designed in such a way, that their nominal current is higher than the nominal current of the drive. The filters are thermally designed for the same overload cycle as the drives.

## 2.3.2 SINE FILTER TYPES

Table 20. Sine filter type

Filter type code	Manufacturer's part code	Rated voltage, 3~[V AC]	Nominal current at 40°C [A]	Nominal current at 50°C [A]	Power loss at 40°C [W]	IP class

### 2.3.3 INSTALLATION

The sine filter connection is shown in Figure 9 on page 22.

**NOTE!** The maximum motor cable length for the sine filter is 300 m. If a longer cable is used, it is recommended to select one current class higher sine-filter type to prevent overheating.

**NOTE!** Cooling of the sine filters is based on natural air convection (AN). Therefore a proper ventilation and placement inside the enclosure must be ensured during assembly. Suitability for base or wall mounting is shown in Table 26.

## Dimension data

Table 24. Sine filter dimensions 1/2

### 3.2 DU/DT-FILTERS IN ENCLOSED DRIVE

Figure 30 represents a dU/dt filter with drive and main switch in enclosure. The main dimensions of the drive are 2200 x 600 x 600 mm (HxWxD).

This representation includes all dU/dt filters up to 600 A with or without drive in enclosure .

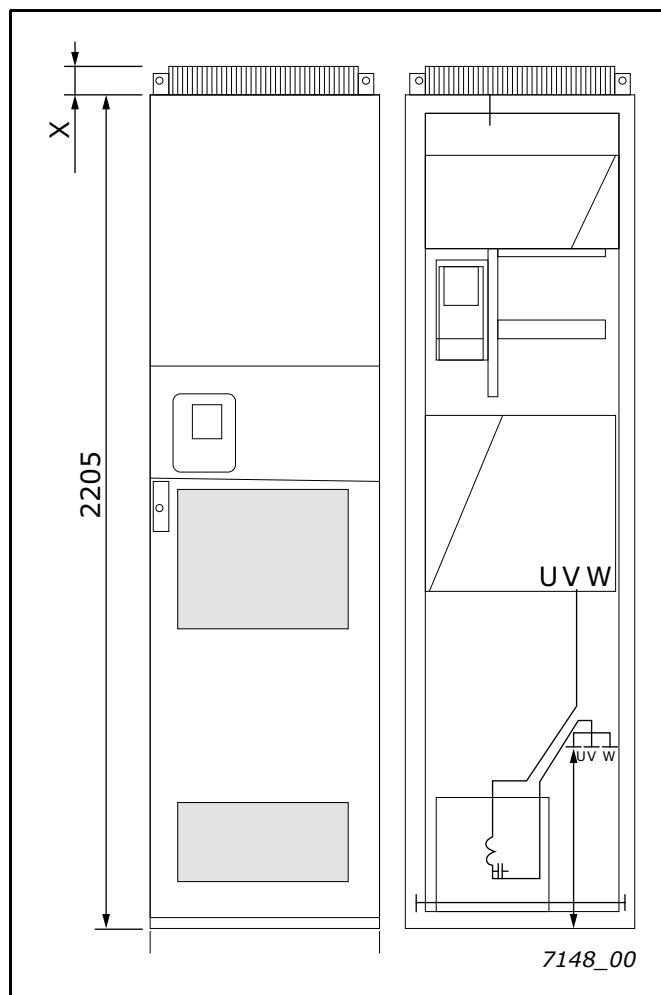

Figure 30. dU/dt filter with drive and main switch in enclosure

- In NFS\_CHK is illustrated 2 x chokes up to 650 A each in a single enclosure with semiconductor fuses. The main dimensions of the drive are 2000 x 400 x 600 mm (HxWxD).
- In IUS\_12\_DUT CTRL is shown 2 x dU/dt-filter up to 600 A each in a single enclosure with control plate, control units, control auxiliaries and other accessories. The main dimensions of the drive are 2000 x 400 x 600 mm (HxWxD).

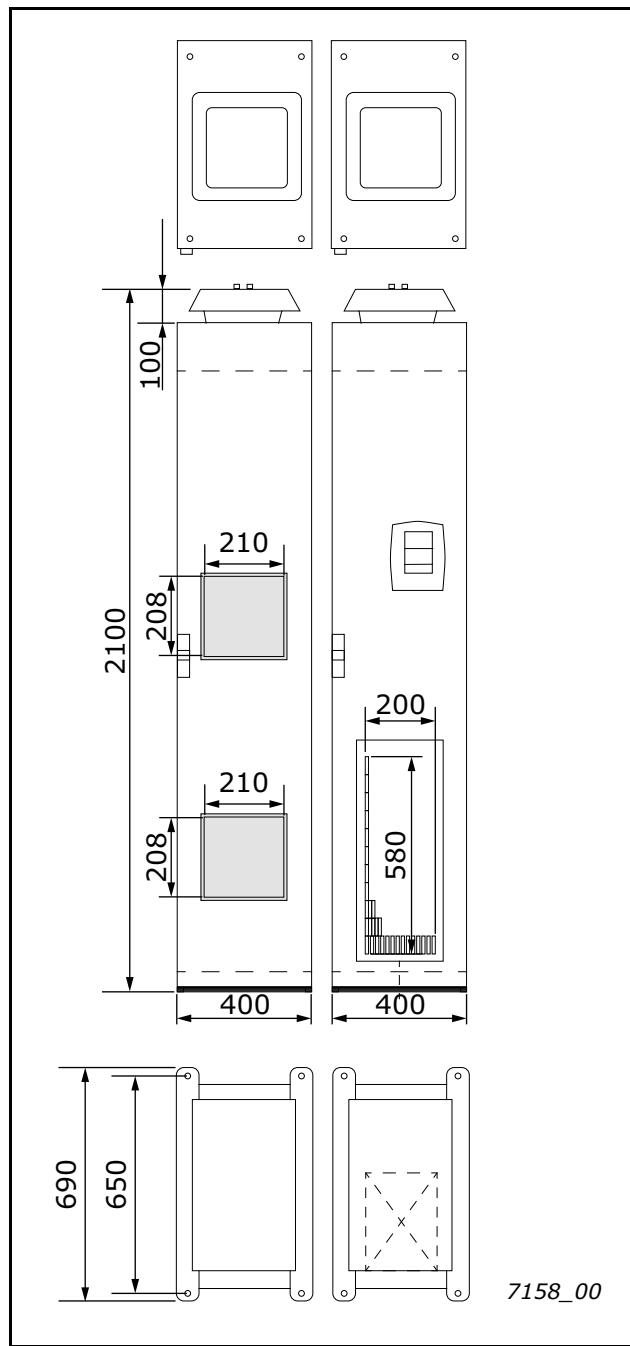

Figure 31. Chokes and dU/dt filters in enclosure

Figure 32 represents a dU/dt filter with drives in enclosure. The main dimensions of the drive are 2200 x 800 x 600 mm (HxWxD).

This representation includes all dU/dt filters up to 1500 A with or without drive in enclosure .

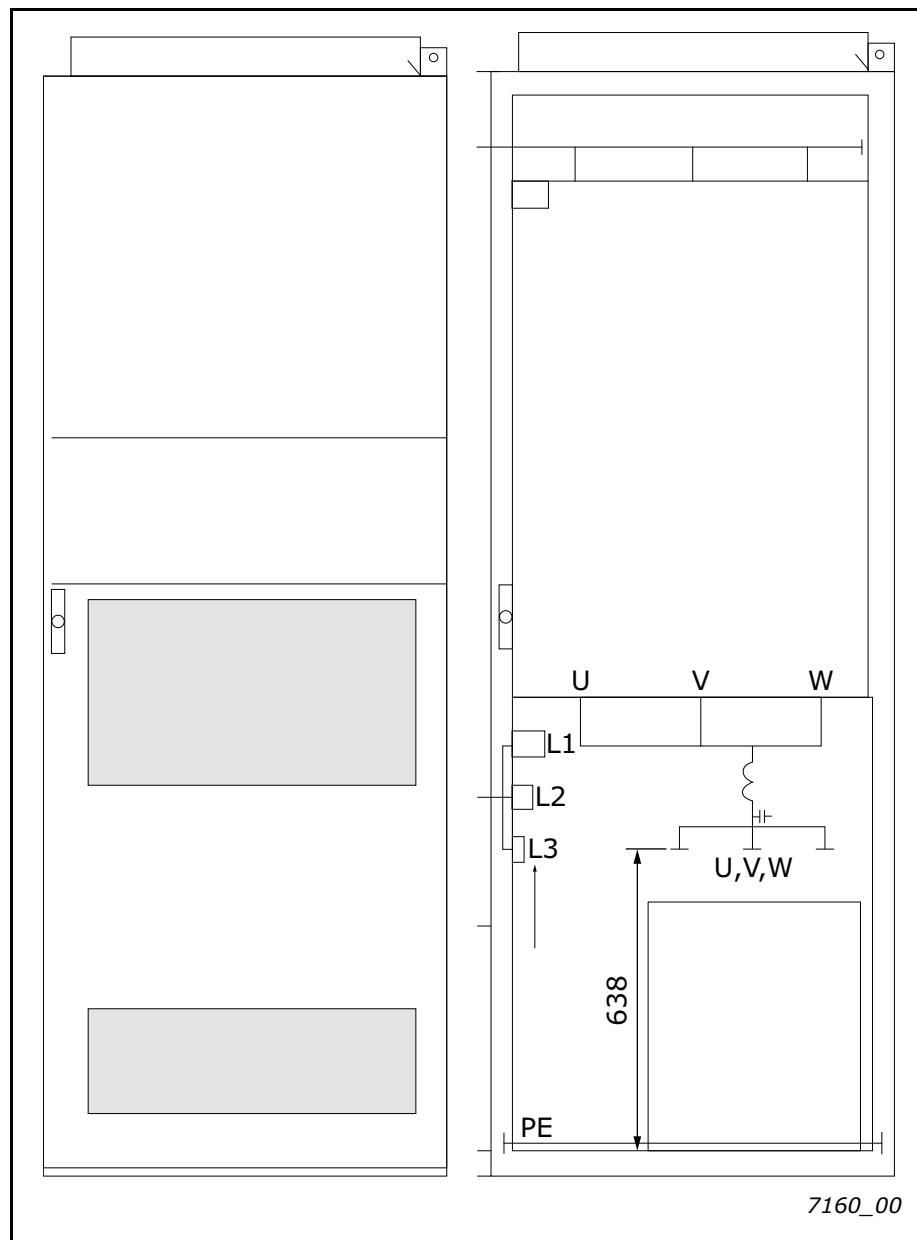

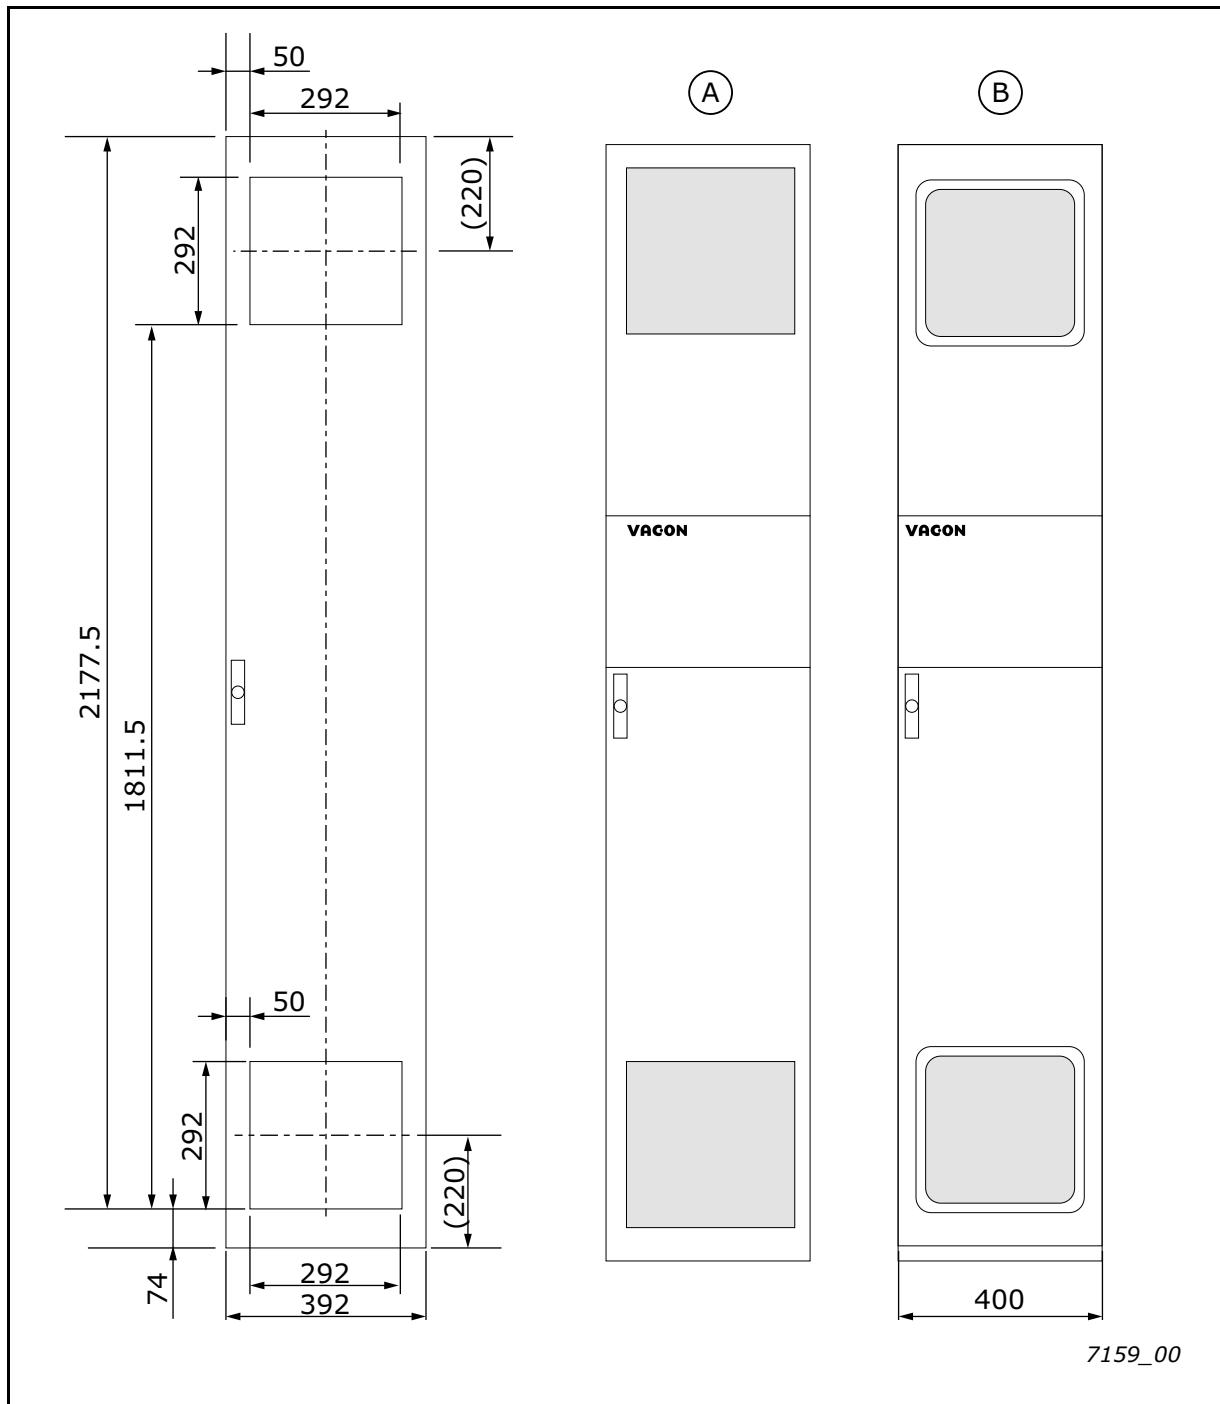

Figure 32. dU/dt filter with drives in enclosure

In Figure 33, there are two dU/dt filters in a single enclosure. The main dimensions of the drive are 2200 x 400 x 600 mm (HxWxD).

This representation includes two dU/dt filters up to 600 A in single enclosure .

Figure 33. Two dU/dt filters in single enclosure

Figure 34 represents a dU/dt filter with drive and main switch in enclosure. The main dimensions of the drive are 2000 x 400 x 600 mm (HxWxD).

This representation includes all dU/dt filters up to 2x80 A or 1x210 A with or without drive in enclosure .

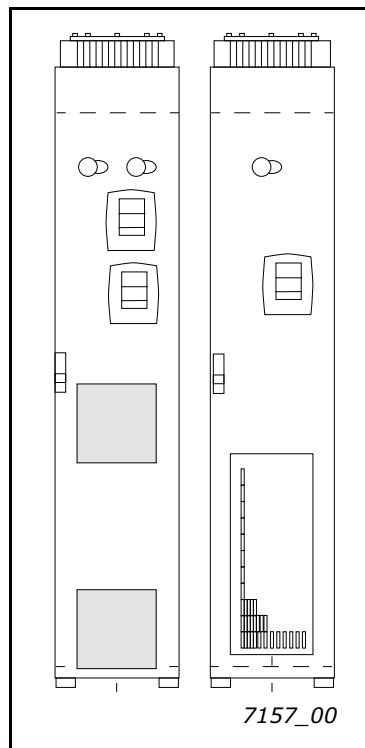

Figure 34. dU/dt filter with or without drive in enclosure

Figure 35 represents a dU/dt filter up to 1500 A in a single enclosure with control plate, control units, control auxiliaries and other accessories. The main dimensions of the drive are 2000 x 600 x 600 mm (HxWxD).

### 3.3 SAFE OPERATING AREA FOR DU/DT-FILTERS

The safe operating area for DUT-0280-6-0-S is shown in Figure 36 - assuming a cable capacitance of 750 pf/m. The values should be scaled in accordance with the actual cable capacitance. In case of multiple cables the capacitance is the sum of the cable capacitances.

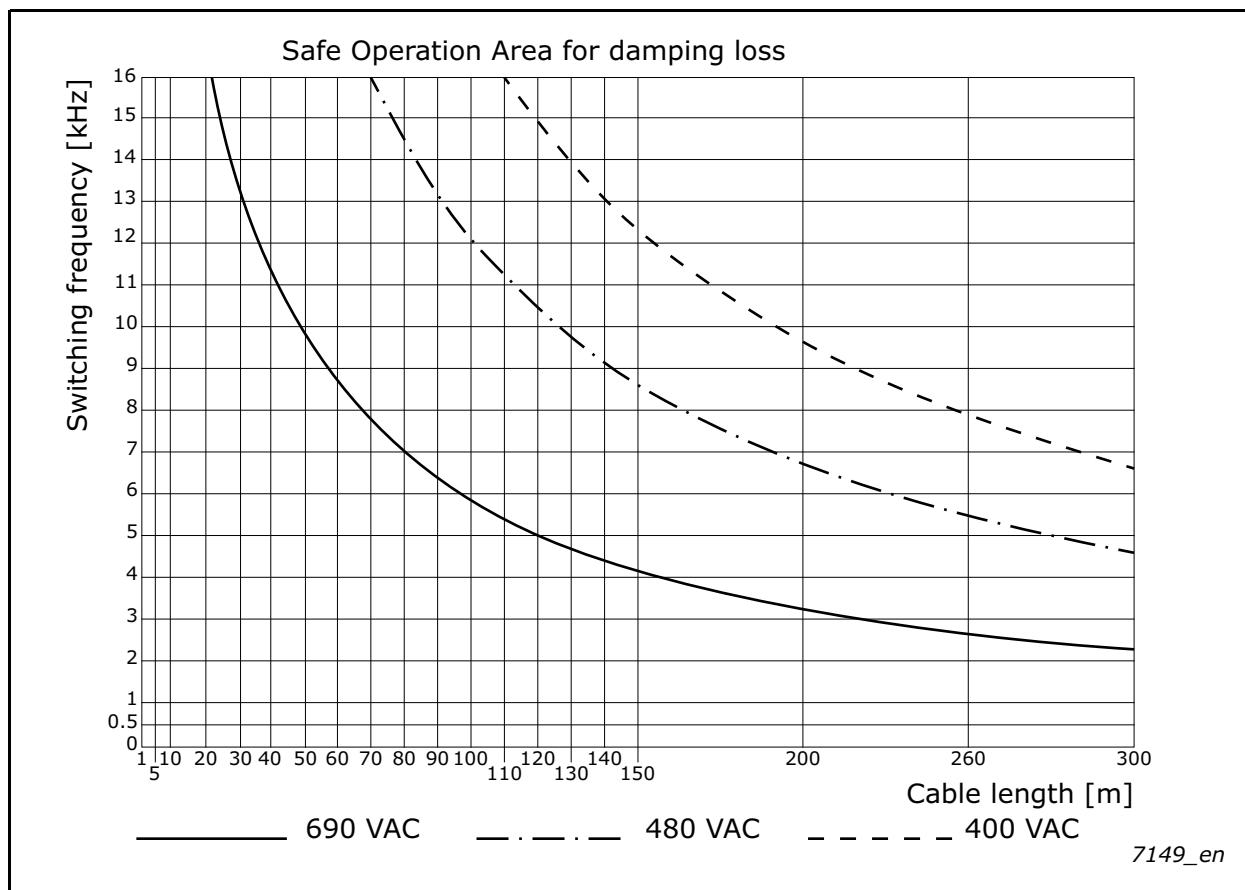

Figure 36. Safe operating area for DUT-0280-6-0-S

The safe operating area for DUT-0420-6-0-S is shown in Figure 37 - assuming a cable capacitance of 800 pf/m. The values should be scaled in accordance with the actual cable capacitance. In case of multiple cables the capacitance is the sum of the cable capacitances.

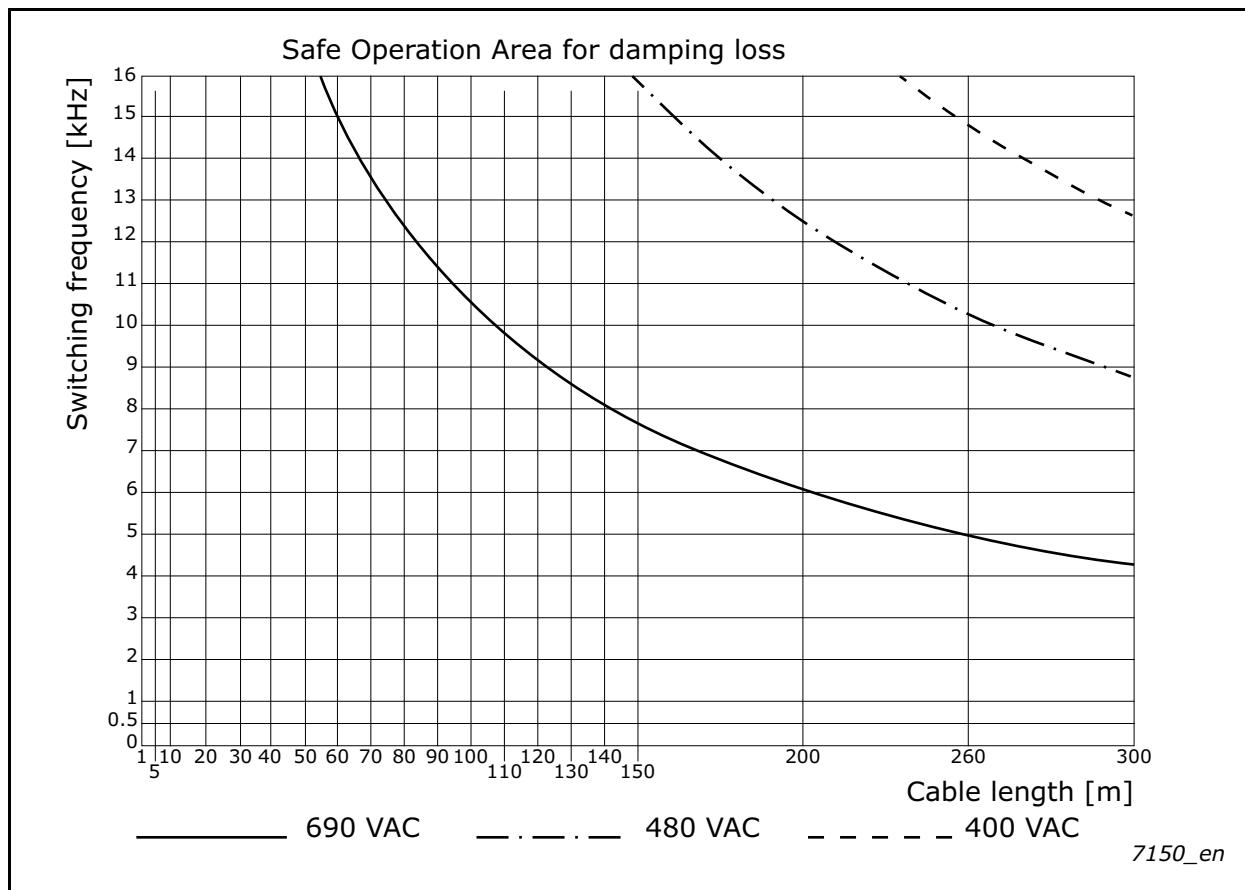

Figure 37. Safe operating area for DUT-0420-6-0-S

The safe operating area for DUT-0590-6-0-S is shown in Figure 38 - assuming a cable capacitance of 1700 pf/m. The values should be scaled in accordance with the actual cable capacitance. In case of multiple cables the capacitance is the sum of the cable capacitances.

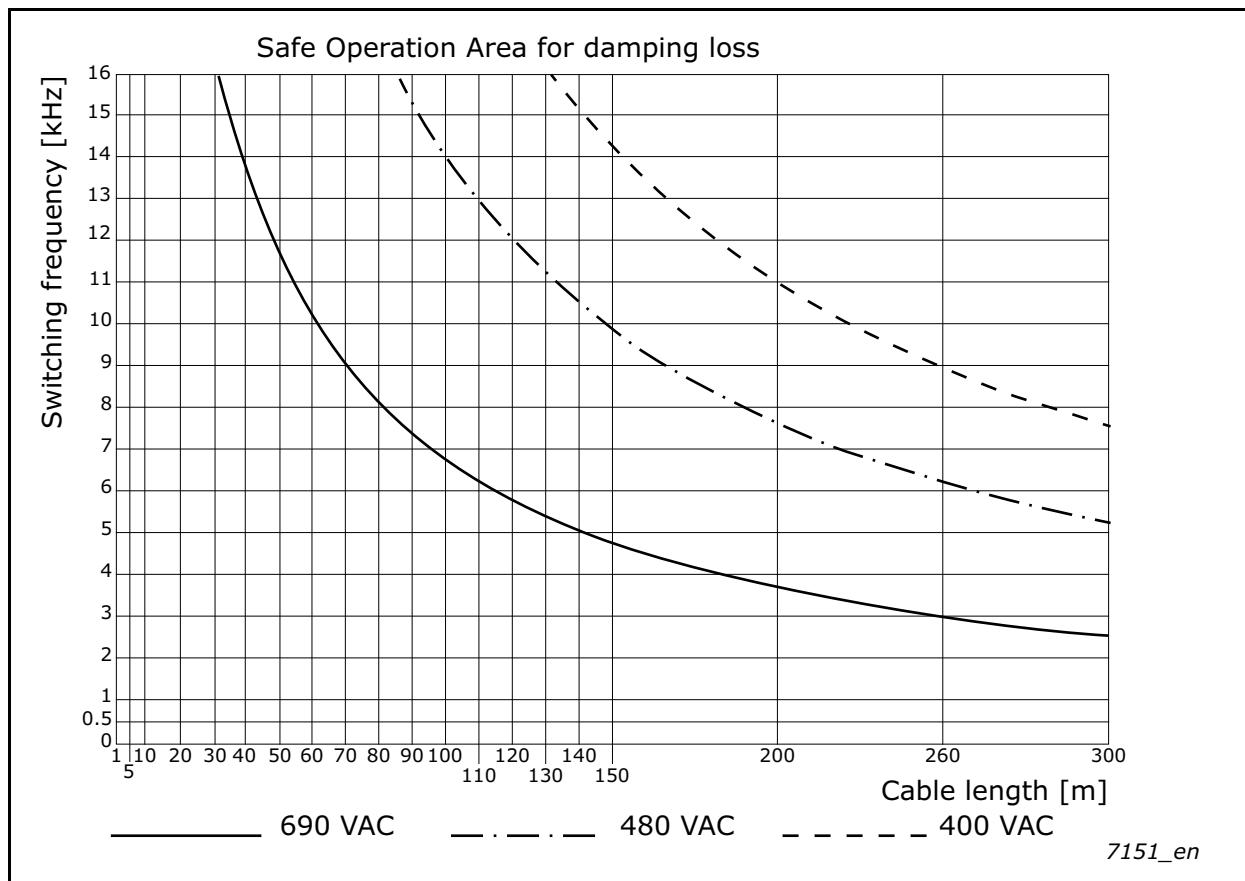

Figure 38. Safe operating area for DUT-0590-6-0-S

The safe operating area for DUT-0820-6-0-S is shown in Figure 39 - assuming a cable capacitance of 1700 pf/m. The values should be scaled in accordance with the actual cable capacitance. In case of multiple cables the capacitance is the sum of the cable capacitances.

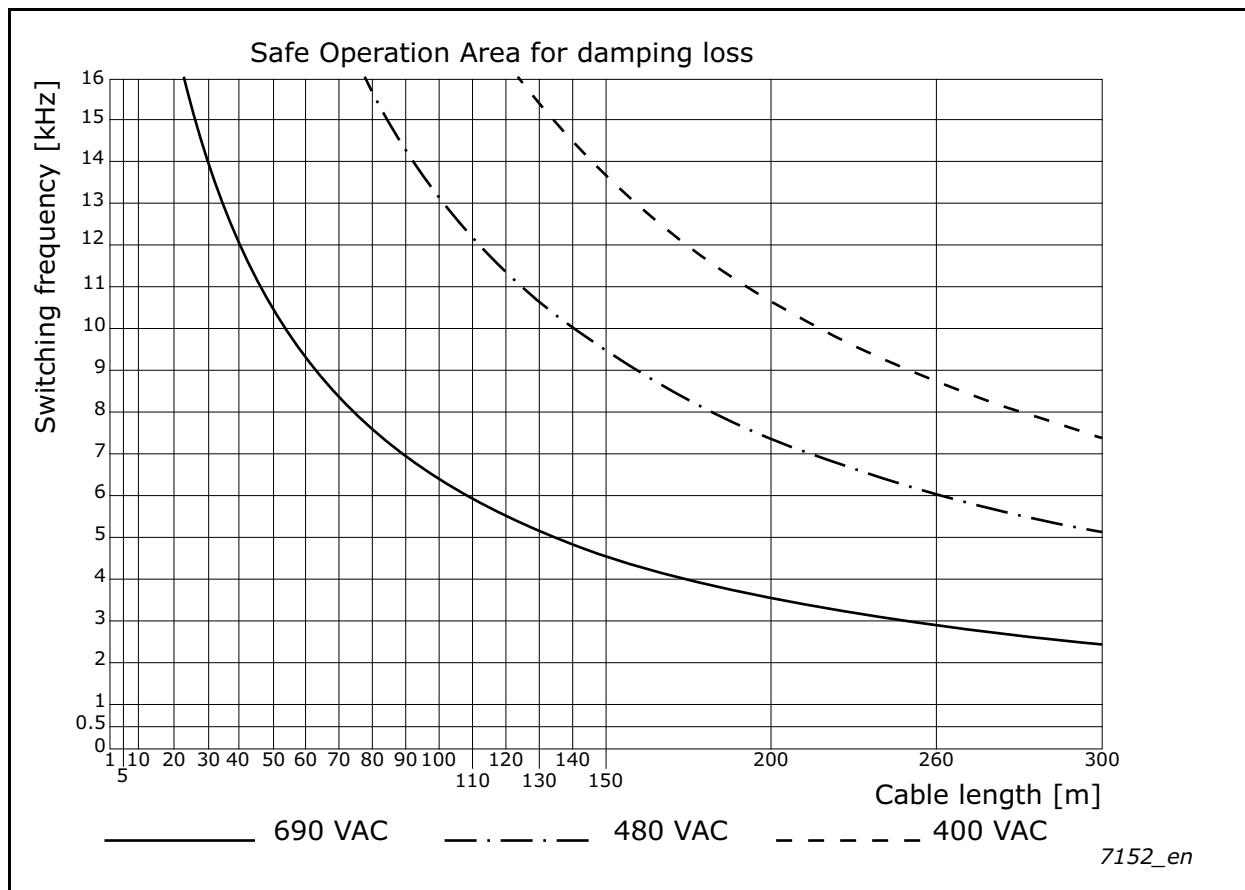

Figure 39. Safe operating area for DUT-0820-6-0-S

The safe operating area for DUT-1250-6-0-S and DUT-1600-6-0-S is shown in Figure 40 - assuming a cable capacitance of 1700 pF/m. The values should be scaled in accordance with the actual cable capacitance. In case of multiple cables the capacitance is the sum of the cable capacitances.

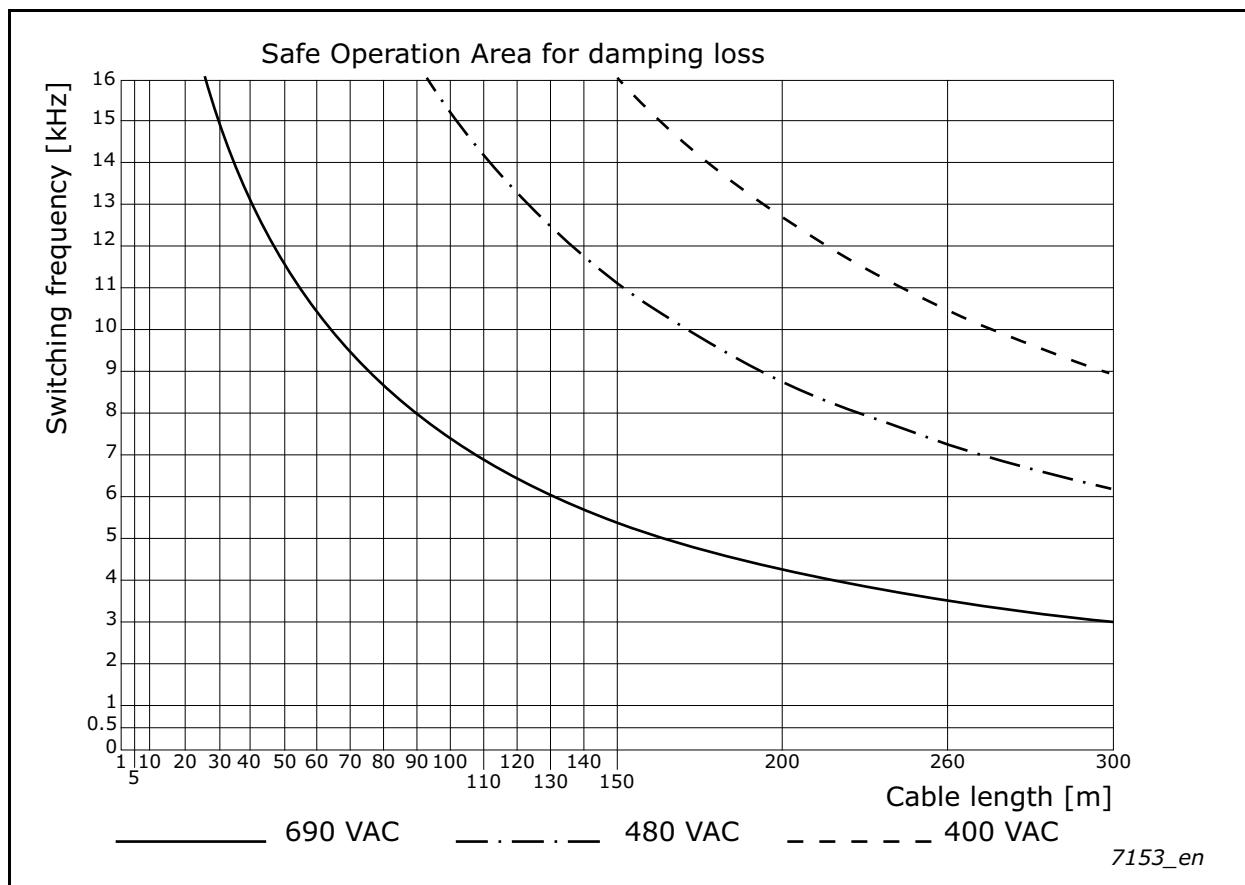

Figure 40. Safe operating area for DUT-1250-6-0-S and DUT-1600-6-0-S

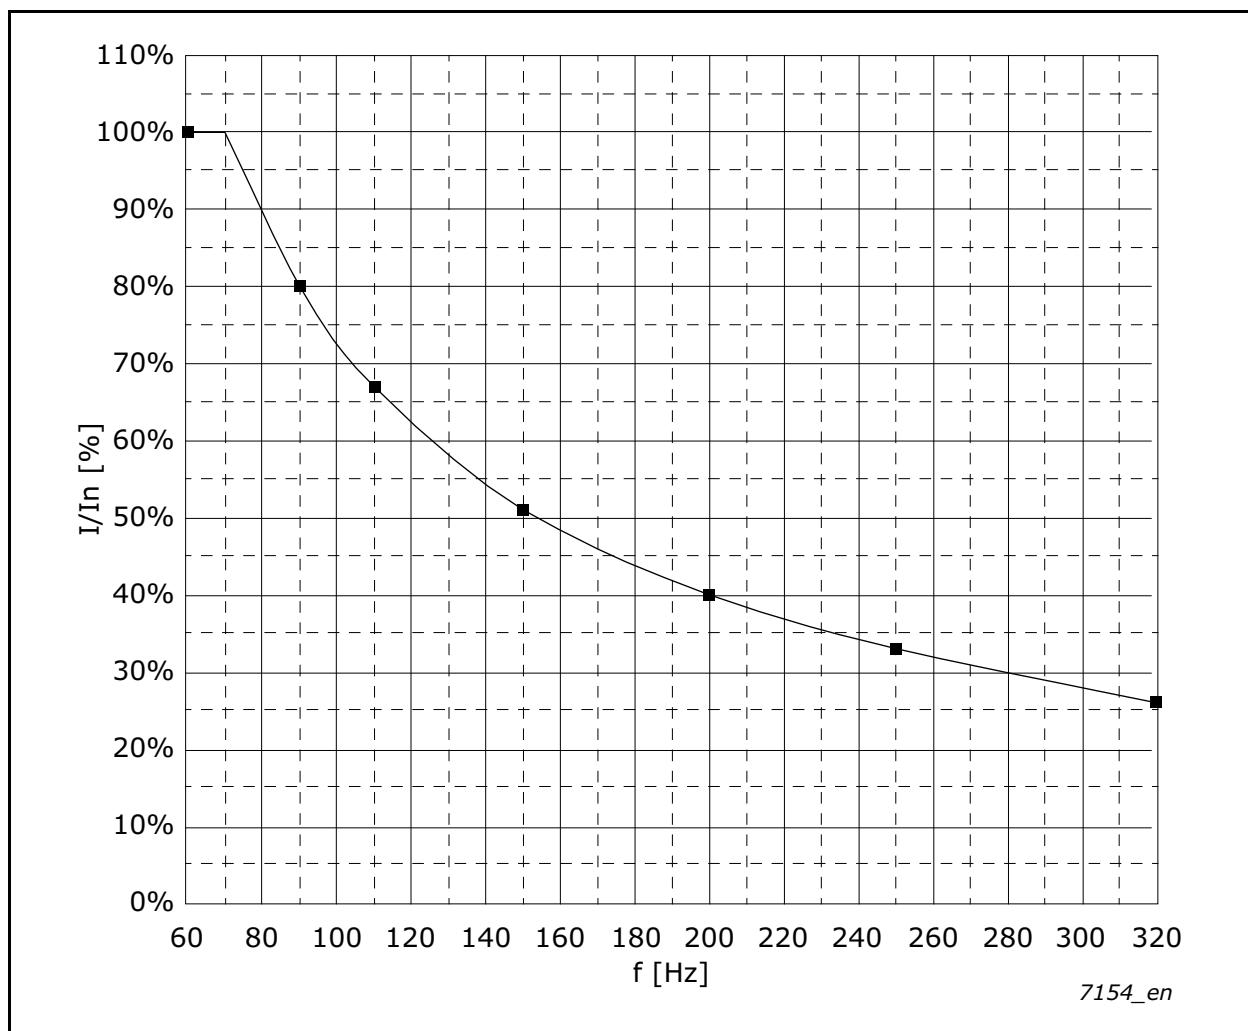

**3.4      OUTPUT CURRENT FOR FREQUENCY OPERATION****P-type dU/dt filters**

Figure 41. P-type dU/dt filters output current derating as a function of output frequency
