1 Introduction

1.1 How to Read This Design Guide

This design guide provides information on how to select, commission, and order a frequency converter. It provides information about mechanical and electrical installation.

The design guide is intended for use by qualified personnel.

Read and follow the design guide to use the frequency converter safely and professionally, and pay particular attention to the safety instructions and general warnings.

VLT® is a registered trademark.

- *VLT® AutomationDrive FC 360 Quick Guide* provides the necessary information for getting the frequency converter up and running.
- *VLT® AutomationDrive FC 360 Programming Guide* provides information on how to program and includes complete parameter descriptions.

FC 360 technical literature is also available online at www.danfoss.com/fc360.

The following symbols are used in this manual:

⚠ WARNING

Indicates a potentially hazardous situation that could result in death or serious injury.

⚠ CAUTION

Indicates a potentially hazardous situation that could result in minor or moderate injury. It may also be used to alert against unsafe practices.

NOTICE

Indicates important information, including situations that may result in damage to equipment or property.

The following conventions are used in this manual:

- Numbered lists indicate procedures.
- Bullet lists indicate other information and description of illustrations.
- Italicized text indicates:
 - Cross-reference.
 - Link.
 - Footnote.
 - Parameter name.
 - Parameter group name.
 - Parameter option.
- All dimensions in drawings are in mm (inch).

1.1.1 Abbreviations

Alternating current	AC
American wire gauge	AWG
Ampere/AMP	A
Automatic motor adaptation	AMA
Current limit	I_{LIM}
Degrees Celsius	°C
Direct current	DC
Drive dependent	D-TYPE
Electromagnetic compatibility	EMC
Electronic thermal relay	ETR
Gram	g
Hertz	Hz
Horsepower	hp
Kilohertz	kHz
Local control panel	LCP
Meter	m
Millihenry inductance	mH
Milliampere	mA
Millisecond	ms
Minute	min
Motion control tool	MCT
Nanofarad	nF
Newton meter	Nm
Nominal motor current	$I_{M,N}$
Nominal motor frequency	$f_{M,N}$
Nominal motor power	$P_{M,N}$
Nominal motor voltage	$U_{M,N}$
Permanent magnet motor	PM motor
Protective extra low voltage	PELV
Printed circuit board	PCB
Rated inverter output current	I_{INV}
Revolutions per minute	RPM
Regenerative terminals	Regen
Second	s
Synchronous motor speed	n_s
Torque limit	T_{LIM}
Volts	V
Maximum output current	$I_{VLT,MAX}$
Rated output current supplied by the frequency converter	$I_{VLT,N}$

1.2 Definitions

1.2.1 Frequency Converter

Coast

The motor shaft is in free mode. No torque on the motor.

$I_{VLT,MAX}$

Maximum output current.

$I_{VLT,N}$

Rated output current supplied by the frequency converter.

$U_{VLT,MAX}$

Maximum output voltage.

1.2.2 Input

Control commands

Start and stop the connected motor with the LCP and digital inputs.

Functions are divided into 2 groups.

Functions in group 1 have higher priority than functions in group 2.

Group 1	Precise stop, coast stop, precise stop and coast stop, quick stop, DC braking, stop, and [OFF].
Group 2	Start, pulse start, start reversing, jog, freeze output, and [Hand On].

Table 1.1 Function Groups

1.2.3 Motor

Motor running

Torque generated on the output shaft and speed from 0 RPM to maximum speed on the motor.

f_{JOG}

Motor frequency when the jog function is activated (via digital terminals or bus).

f_M

Motor frequency.

f_{MAX}

Maximum motor frequency.

f_{MIN}

Minimum motor frequency.

$f_{M,N}$

Rated motor frequency (nameplate data).

I_M

Motor current (actual).

$I_{M,N}$

Nominal motor current (nameplate data).

$n_{M,N}$

Nominal motor speed (nameplate data).

n_s

Synchronous motor speed.

$$n_s = \frac{2 \times \text{Parameter 1-23} \times 60 \text{ s}}{\text{Parameter 1-39}}$$

n_{slip}

Motor slip.

$P_{M,N}$

Rated motor power (nameplate data in kW or hp).

$T_{M,N}$

Rated torque (motor).

U_M

Instantaneous motor voltage.

$U_{M,N}$

Rated motor voltage (nameplate data).

Break-away torque

175ZA078:10

Illustration 1.1 Break-away Torque

η_{VLT}

The efficiency of the frequency converter is defined as the ratio between the power output and the power input.

Start-disable command

A start-disable command belonging to the control commands in group 1. See *Table 1.1* for more details.

Stop command

A stop command belonging to the control commands in group 1. See *Table 1.1* for more details.

1.2.4 References

Analog reference

A signal transmitted to the analog inputs 53 or 54 can be voltage or current.

Binary reference

A signal transmitted via the serial communication port.

Preset reference

A defined preset reference to be set from -100% to +100% of the reference range. Selection of 8 preset references via the digital terminals. Selection of 4 preset references via the bus.

Pulse reference

A pulse frequency signal transmitted to the digital inputs (terminal 29 or 33).

Ref_{MAX}

Determines the relationship between the reference input at 100% full scale value (typically 10 V, 20 mA) and the resulting reference. The maximum reference value is set in *parameter 3-03 Maximum Reference*.

Ref_{MIN}

Determines the relationship between the reference input at 0% value (typically 0 V, 0 mA, 4 mA) and the resulting reference. The minimum reference value is set in *parameter 3-02 Minimum Reference*.

1.2.5 Miscellaneous

Analog inputs

The analog inputs are used for controlling various functions of the frequency converter.

There are 2 types of analog inputs:

- Current input: 0–20 mA and 4–20 mA.
- Voltage input: 0–10 V DC.

Analog outputs

The analog outputs can supply a signal of 0–20 mA or 4–20 mA.

Automatic motor adaptation, AMA

The AMA algorithm determines the electrical parameters for the connected motor at standstill.

Brake resistor

The brake resistor is a module capable of absorbing the brake power generated in regenerative braking. This regenerative brake power increases the DC-link voltage and a brake chopper ensures that the power is transmitted to the brake resistor.

CT characteristics

Constant torque characteristics used for all applications such as conveyor belts, displacement pumps, and cranes.

Digital inputs

The digital inputs can be used for controlling various functions of the frequency converter.

Digital outputs

The frequency converter features 2 solid-state outputs that can supply a 24 V DC (maximum 40 mA) signal.

ETR

Electronic thermal relay is a thermal load calculation based on present load and time. Its purpose is to estimate the motor temperature.

FC standard bus

Includes RS485 bus with FC protocol or MC protocol. See *parameter 8-30 Protocol*.

Initializing

If initializing is carried out (*parameter 14-22 Operation Mode* or 2-finger reset), the frequency converter returns to the default setting.

Intermittent duty cycle

An intermittent duty rating refers to a sequence of duty cycles. Each cycle consists of an on-load and an off-load period. The operation can be either periodic duty or non-periodic duty.

LCP

The local control panel makes up a complete interface for control and programming of the frequency converter. The LCP is detachable. With the installation kit option, the LCP can be installed up to 3 m (9.8 ft) from the frequency converter in a front panel.

GLCP

The graphic local control panel (LCP 102) interface for control and programming of the frequency converter. The display is graphic and the panel is used to show process values. The GLCP has storing and copy functions.

NLCP

The numerical local control panel (LCP 21) interface for control and programming of the frequency converter. The display is numerical and the panel is used to show process values. The NLCP has storing and copy functions.

lsb

Least significant bit.

msb

Most significant bit.

MCM

Short for mille circular mil, an American measuring unit for cable cross-section. 1 MCM = 0.5067 mm².

On-line/off-line parameters

Changes to on-line parameters are activated immediately after the data value is changed. To activate changes to off-line parameters, press [OK].

Process PID

The PID control maintains speed, pressure, and temperature by adjusting the output frequency to match the varying load.

PCD

Process control data.

Power cycle

Switch off the mains until the display (LCP) is dark, then turn power on again.

Power factor

The power factor is the relation between I_1 and I_{RMS} .

$$\text{Power factor} = \frac{\sqrt{3} \times U \times I_1 \cos\phi_1}{\sqrt{3} \times U \times I_{RMS}}$$

For VLT® AutomationDrive FC 360 frequency converters, $\cos\phi_1 = 1$, therefore:

$$\text{Power factor} = \frac{I_1 \times \cos\phi_1}{I_{RMS}} = \frac{I_1}{I_{RMS}}$$

The power factor indicates to which extent the frequency converter imposes a load on the mains supply.

The lower the power factor, the higher the I_{RMS} for the same kW performance.

$$I_{RMS} = \sqrt{I_1^2 + I_5^2 + I_7^2 + \dots + I_n^2}$$

In addition, a high power factor indicates that the different harmonic currents are low.

The built-in DC coils produce a high power factor, minimizing the imposed load on the mains supply.

Pulse input/incremental encoder

An external, digital pulse transmitter used for feeding back information on motor speed. The encoder is used in applications where great accuracy in speed control is required.

RCD

Residual current device.

Set-up

Save parameter settings in 2 set-ups. Change between the 2 parameter set-ups and edit 1 set-up while another set-up is active.

SFAVM

Acronym describing the switching pattern stator flux-oriented asynchronous vector modulation.

Slip compensation

The frequency converter compensates for the motor slip by giving the frequency a supplement that follows the measured motor load, keeping the motor speed almost constant.

Smart logic control (SLC)

The SLC is a sequence of user-defined actions executed when the smart logic controller evaluates the associated user-defined events as true (*parameter group 13-** Smart Logic Control*).

STW

Status word.

THD

Total harmonic distortion states the total contribution of harmonic distortion.

Thermistor

A temperature-dependent resistor placed where the temperature is monitored (frequency converter or motor).

Trip

A state entered in fault situations, for example if the frequency converter is subject to overvoltage or when it is protecting the motor, process, or mechanism. Restart is prevented until the cause of the fault has disappeared, and the trip state is canceled by activating reset or, sometimes, by being programmed to reset automatically. Do not use trip for personal safety.

Trip lock

Trip lock is a state entered in fault situations when the frequency converter is protecting itself and requiring physical intervention. An example causing a trip lock is the frequency converter being subject to a short circuit on the output. A locked trip can only be canceled by cutting off mains, removing the cause of the fault, and reconnecting the frequency converter. Restart is prevented until the trip state is canceled by activating reset or, sometimes, by being programmed to reset automatically. Do not use trip lock for personal safety.

VT characteristics

Variable torque characteristics used for pumps and fans.

VVC⁺

If compared with standard voltage/frequency ratio control, voltage vector control (VVC⁺) improves the dynamics and stability, both when the speed reference is changed and in relation to the load torque.

60° AVM

Refers to the switching pattern *60° asynchronous vector modulation*.

1.3 Safety Precautions**⚠ WARNING**

The voltage of the frequency converter is dangerous whenever connected to mains. Incorrect installation of the motor, frequency converter or fieldbus may cause death, serious personal injury or damage to the equipment. Consequently, the instructions in this manual, as well as national and local rules and safety regulations, must be complied with.

Safety Regulations

1. Always disconnect mains supply to the frequency converter before carrying out repair work. Check that the mains supply has been disconnected and observe the discharge time stated in *Table 1.2* before removing motor and mains supply.
2. [Off/Reset] on the LCP does not disconnect the mains supply and must not be used as a safety switch.
3. Ground the equipment properly, protect the user against supply voltage, and protect the motor against overload in accordance with applicable national and local regulations.
4. Protection against motor overload is not included in the factory setting. If this function is desired, set *parameter 1-90 Motor Thermal Protection* to [4] *ETR trip 1* or [3] *ETR warning 1*.
5. The frequency converter has more voltage sources than L1, L2 and L3, when load sharing (linking of DC intermediate circuit). Check that all voltage sources have been disconnected and that the necessary time has elapsed before commencing repair work.

Warning against unintended start

1. The motor can be stopped with digital commands, bus commands, references or a local stop, while the frequency converter is connected to mains. If personal safety considerations (e.g. risk of personal injury caused by contact with moving parts following an unintentional start) make it necessary to ensure that no unintended start occurs, these stop functions are not sufficient. In such cases, disconnect the mains supply.
2. The motor may start while setting the parameters. If this means that personal safety may be compromised, motor starting must be prevented, for instance by secure disconnection of the motor connection.
3. A motor that has been stopped with the mains supply connected, may start if faults occur in the electronics of the frequency converter, through temporary overload or if a fault in the power supply grid or motor connection is remedied. If unintended start must be prevented for personal safety reasons, the normal stop functions of the frequency converter are not sufficient. In such cases, disconnect the mains supply.
4. In rare cases, control signals from, or internally within, the frequency converter may be activated in error, be delayed, or fail to occur entirely. When used in situations where safety is critical, e.g. when controlling the electromagnetic brake function of a hoist application, do not rely on these control signals exclusively.

⚠ WARNING

HIGH VOLTAGE

Touching the electrical parts may be fatal even after the equipment has been disconnected from mains.

Make sure that all voltage inputs have been disconnected, including load sharing (linkage of DC intermediate circuit), as well as motor connection for kinetic back up.

Systems where frequency converters are installed must, if necessary, be equipped with additional monitoring and protective devices according to valid safety regulations, such as laws on mechanical tools, regulations for the prevention of accidents, etc. Modifications to the frequency converters via the operating software are allowed.

NOTICE

Hazardous situations shall be identified by the machine builder/integrator responsible for considering necessary preventive means. Additional monitoring and protective devices may be included, always according to valid national safety regulations, such as laws on mechanical tools and regulations for the prevention of accidents.

⚠ WARNING

DISCHARGE TIME

The frequency converter contains DC-link capacitors, which can remain charged even when the frequency converter is not powered. High voltage can be present even when the warning LED indicator lights are off.

Failure to wait the specified time after power has been removed before performing service or repair work can result in death or serious injury.

- Stop the motor.
- Disconnect AC mains and remote DC-link power supplies, including battery back-ups, UPS, and DC-link connections to other frequency converters.
- Disconnect or lock PM motor.
- Wait for the capacitors to discharge fully. The minimum waiting time is specified in *Table 1.2* and is also visible on the product label on top of the frequency converter.
- Before performing any service or repair work, use an appropriate voltage measuring device to make sure that the capacitors are fully discharged.

Voltage [V]	Power range [kW (hp)]	Minimum waiting time (minutes)
380–480	0.37–7.5 kW (0.5–10 hp)	4
380–480	11–75 kW (15–100 hp)	15

Table 1.2 Discharge Time

1.4 Disposal Instruction

Equipment containing electrical components may not be disposed of together with domestic waste. It must be collected separately with electrical and electronic waste according to local and currently valid legislation.

1.5 Document and Software Version

This manual is regularly reviewed and updated. All suggestions for improvement are welcome.

Edition	Remarks	Software version
MG06B5xx	Update due to new hardware and software release.	1.8x

1.6 Approvals and Certifications

Frequency converters are designed in compliance with the directives described in this section.

For more information on approvals and certificates, go to the download area at www.danfoss.com/fc360.

1.6.1 CE Mark

The CE mark (Conformité Européenne) indicates that the product manufacturer conforms to all applicable EU directives.

The EU directives applicable to the design and manufacture of drives are:

- The Low Voltage Directive.
- The EMC Directive.
- The Machinery Directive (for units with an integrated safety function).

The CE mark is intended to eliminate technical barriers to free trade between the EC and EFTA states inside the ECU. The CE mark does not regulate the quality of the product. Technical specifications cannot be deduced from the CE mark.

1.6.2 Low Voltage Directive

Drives are classified as electronic components and must be CE-labeled in accordance with the Low Voltage Directive. The directive applies to all electrical equipment in the 50–1000 V AC and the 75–1500 V DC voltage ranges.

The directive mandates that the equipment design must ensure the safety and health of people and livestock, and the preservation of material by ensuring the equipment is properly installed, maintained, and used as intended. Danfoss CE labels comply with the Low Voltage Directive, and Danfoss provides a declaration of conformity upon request.

1.6.3 EMC Directive

Electromagnetic compatibility (EMC) means that electro-magnetic interference between pieces of equipment does not hinder their performance. The basic protection requirement of the EMC Directive 2014/30/EU states that devices that generate electromagnetic interference (EMI) or whose operation could be affected by EMI must be designed to limit the generation of electromagnetic interference and shall have a suitable degree of immunity to EMI when properly installed, maintained, and used as intended.

A drive can be used as stand-alone device or as part of a more complex installation. Devices in either of these cases must bear the CE mark. Systems must not be CE-marked but must comply with the basic protection requirements of the EMC directive.

2 Product Overview

2

2.1 Enclosure Size Overview

Enclosure size depends on power range.

Enclosure size	J1	J2	J3	J4
	 130BA870.10	 130BA809.10	 130BA810.10	 130BA810.10
Enclosure protection	IP20	IP20	IP20	IP20
High overload rated power - maximum 160% overload ¹⁾	0.37–2.2 kW/0.5–3 hp (380–480 V)	3.0–5.5 kW/4.0–7.5 hp (380–480 V)	7.5 kW/10 hp (380–480 V)	11–15 kW/15–20 hp (380–480 V)
Enclosure size	J5	J6	J7	
	 130BA810.10	 130BA826.10	 130BA826.10	
Enclosure protection	IP20	IP20	IP20	
High overload rated power - maximum 160% overload ¹⁾	18.5–22 kW/25–30 hp (380–480 V)	30–45 kW/40–60 hp (380–480 V)	55–75 kW/75–100 hp (380–480 V)	

Table 2.1 Enclosure Sizes

¹⁾ Sizes 11–75 kW (15–100 hp) normal overload type: 110% overload 1 minute.

Sizes 0.37–7.5 kW (0.5–10 hp) high overload type: 160% overload 1 minute.

Sizes 11–22 kW (15–30 hp) high overload type: 150% overload 1 minute.

Sizes 30–75 kW (40–100 hp) high overload type: 150% overload 1 minute.

2.2 Electrical Installation

This section describes how to wire the frequency converter.

2

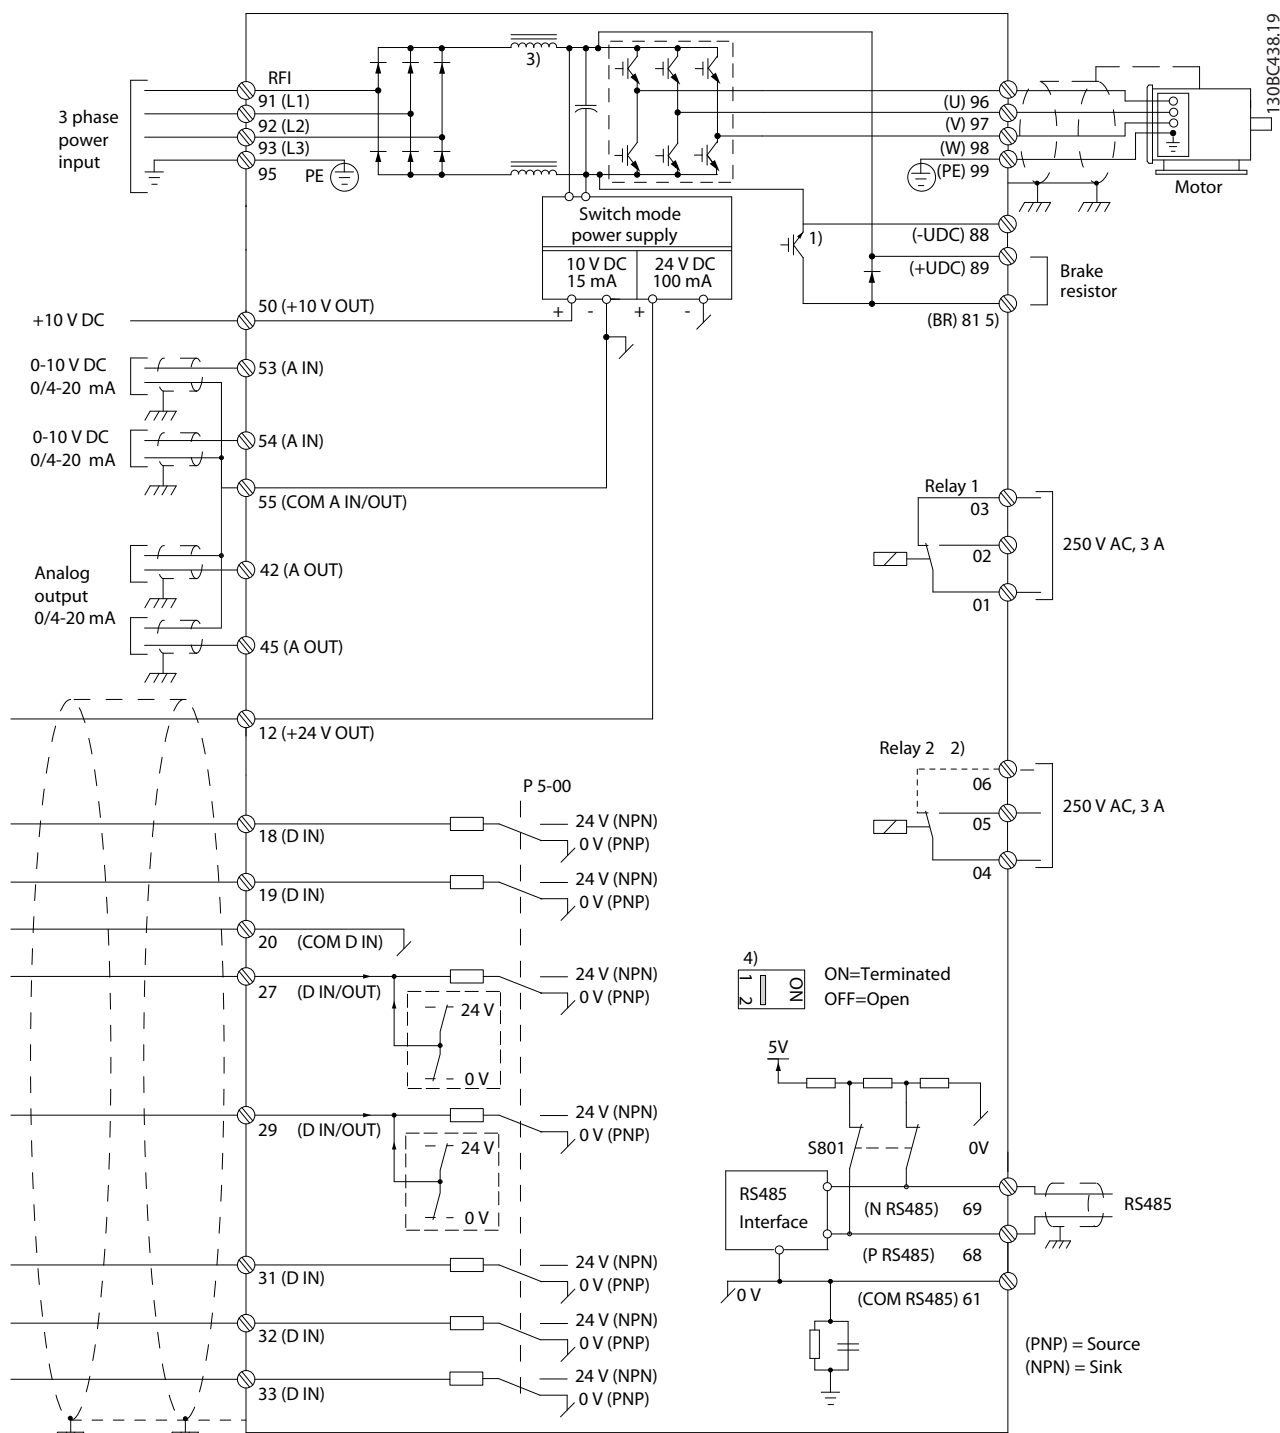

Illustration 2.1 Basic Wiring Schematic Drawing

A=Analog, D=Digital

1) Built-in brake chopper available from J1-J5.

2) Relay 2 is 2-pole for J1-J3 and 3-pole for J4-J7. Relay 2 of J4-J7 with terminals 4, 5, and 6 has same NO/NC logic as relay 1. Relays are pluggable in J1-J5 and fixed in J6-J7.

3) Single DC choke in J1–J5; dual DC choke in J6–J7.

4) Switch S801 (bus terminal) can be used to enable termination on the RS485 port (terminals 68 and 69).

5) No BR for J6–J7.

1	PLC	10	Mains cable (unshielded)
2	Minimum 16 mm ² (6 AWG) equalizing cable	11	Output contactor, and more.
3	Control cables	12	Cable insulation stripped
4	Minimum 200 mm (7.87 in) between control cables, motor cables, and mains cables.	13	Common ground busbar. Follow local and national requirements for cabinet grounding.
5	Mains supply	14	Brake resistor
6	Bare (unpainted) surface	15	Metal box
7	Star washers	16	Connection to motor
8	Brake cable (shielded)	17	Motor
9	Motor cable (shielded)	18	EMC cable gland

Illustration 2.2 Typical Electrical Connection

2

⚠ WARNING

EQUIPMENT HAZARD

Rotating shafts and electrical equipment can be hazardous. It is important to protect against electrical hazards when applying power to the unit. All electrical work must conform to national and local electrical codes. Installation, start up, and maintenance must be performed only by trained and qualified personnel. Failure to follow these guidelines could result in death or serious injury.

⚠ WARNING

WIRING ISOLATION

Run input power, motor wiring, and control wiring in 3 separate metallic conduits, or use separated shielded cables for high-frequency noise isolation. Failure to isolate power, motor, and control wiring could result in less than optimum frequency converter and associated equipment performance.

Run motor cables from multiple frequency converters separately. Induced voltage from output motor cables run together can charge equipment capacitors even with the equipment turned off and locked out. Failure to run output motor cables separately or use shielded cables could result in death or serious injury.

- Run output motor cables separately.
- Use shielded cables.
- Lock out all frequency converters simultaneously.

Wire type and ratings

- All wiring must comply with local and national regulations regarding cross-section and ambient temperature requirements.
- Danfoss recommends that all power connections are made with a minimum 75 °C (167 °F) rated copper wire.
- See *chapter 4 Specifications* for recommended wire sizes.

2.2.1 Grounding Requirements

⚠ WARNING

GROUNDING HAZARD!

For operator safety, a certified electrical installer should ground the frequency converter in accordance with national and local electrical codes as well as instructions contained within this manual. Ground currents are higher than 3.5 mA. Failure to ground the frequency converter properly could result in death or serious injury.

- Establish proper protective grounding for equipment with ground currents higher than 3.5 mA. See *chapter 2.8 Earth Leakage Current* for details.
- A dedicated ground wire is required for input power, motor power, and control wiring.
- Use the clamps provided with the equipment for proper ground connections.
- Do not ground 1 frequency converter to another in a "daisy chain" fashion (see *Illustration 2.3*).
- Keep the ground wire connections as short as possible.
- Use high-strand wire to reduce electrical noise.
- Follow motor manufacturer wiring requirements.

Illustration 2.3 Grounding Principle

⚠ WARNING

INDUCED VOLTAGE

Run output motor cables from multiple frequency converters separately. Induced voltage from output motor cables run together can charge equipment capacitors even when the equipment is turned off and locked out. Failure to run output motor cables separately could result in death or serious injury.

Grounding clamps are provided for motor wiring (see *Illustration 2.4*).

- Do not install power factor correction capacitors between the frequency converter and the motor.
- Do not wire a starting or pole-changing device between the frequency converter and the motor.
- Follow motor manufacturer wiring requirements.
- All frequency converters must be used with an isolated input source and with ground reference power lines. When supplied from an isolated mains source (IT mains or floating delta) or TT/TN-S mains with a grounded leg (grounded delta), set *parameter 14-50 RFI Filter* to OFF (enclosure sizes J6–J7) or remove the RFI screw (enclosure sizes J1–J5). When off, the internal RFI filter capacitors between the chassis and the intermediate circuit are isolated to avoid damage to the intermediate circuit and reduce ground capacity currents in accordance with IEC 61800-3.
- Do not install a switch between the frequency converter and the motor in IT mains.

Illustration 2.4 Mains, Motor, and Ground Connections for Enclosure Sizes J1–J5 (Taking J2 as an Example)

Illustration 2.5 Mains, Motor, and Ground Connections for Enclosure Sizes J6–J7 (Taking J7 as an Example)

Illustration 2.4 shows mains input, motor, and grounding for enclosure sizes J1–J5. *Illustration 2.5* shows mains input, motor, and grounding for enclosure sizes J6–J7. Actual configurations vary with unit types and optional equipment.

2.2.2 Control Wiring

Access

- Remove the cover plate with a screwdriver. See *Illustration 2.6*.

1308C504.11

Illustration 2.6 Control Wiring Access for Enclosure Sizes J1-J7

Control Terminal Types

Illustration 2.7 shows the frequency converter control terminals. Terminal functions and default settings are summarized in *Table 2.2*.

1308C505.12

Illustration 2.7 Control Terminal Locations

Terminal	Parameter	Default setting	Description
Digital I/O, Pulse I/O, Encoder			
12	–	+24 V DC	24 V DC supply voltage. Maximum output current is 100 mA for all 24 V loads.
18	Parameter 5-10 Terminal 18 Digital Input	[8] Start	Digital inputs.
19	Parameter 5-11 Terminal 19 Digital Input	[10] Reversing	
31	Parameter 5-16 Terminal 31 Digital Input	[0] No operation	
32	Parameter 5-14 Terminal 32 Digital Input	[0] No operation	Digital input, 24 V encoder. Terminal 33 can be used for pulse input.
33	Parameter 5-15 Terminal 33 Digital Input	[0] No operation	
27	Parameter 5-12 Terminal 27 Digital Input Parameter 5-30 Terminal 27 Digital Output	DI [2] Coast inverse DO [0] No operation	Selectable for either digital input, digital output or pulse output. Default setting is digital input. Terminal 29 can be used for pulse input.
29	Parameter 5-13 Terminal 29 Digital Input Parameter 5-31 Terminal 29 Digital Output	DI [14] Jog DO [0] No operation	
20	–		Common for digital inputs and 0 V potential for 24 V supply.
Analog inputs/outputs			
42	Parameter 6-91 Terminal 42 Analog Output	[0] No operation	Programmable analog output. The analog signal is 0–20 mA or 4–20 mA at a maximum of 500 Ω. Can also be configured as digital outputs
45	Parameter 6-71 Terminal 45 Analog Output	[0] No operation	

See *chapter 4.2 General Specifications* for terminal ratings details.

Terminal	Parameter	Default setting	Description
50	–	+10 V DC	10 V DC analog supply voltage. 15 mA maximum commonly used for potentiometer or thermistor.
53	6-1* parameter group	Reference	Analog input. Selectable for voltage or current.
54	6-2* parameter group	Feedback	
55	–		Common for analog input
Serial communication			
61	–		Integrated RC Filter for shield. ONLY for connecting the screen when experiencing EMC problems.
68 (+)	8-3* parameter group		RS485 interface. A control card switch is provided for termination resistance.
69 (-)	8-3* parameter group		
Relays			
01, 02, 03	5-40 [0]	[0] No operation	Form C relay output. These relays are in various locations depending upon the frequency converter configuration and size. Usable for AC or DC voltage and resistive or inductive loads. RO2 in J1–J3 enclosure is 2-pole, only terminals 04 and 05 are available
04, 05, 06	5-40 [1]	[0] No operation	

Table 2.2 Terminal Descriptions

Control terminal functions

Frequency converter functions are commanded by receiving control input signals.

- Program each terminal for the function it supports in the parameters associated with that terminal.
- Confirm that the control terminal is programmed for the correct function. See *chapter Local Control Panel and Programming* in the quick guide for details on accessing parameters and programming.
- The default terminal programming initiates frequency converter functioning in a typical operational mode.

Using shielded control cables

The preferred method in most cases is to secure control and serial communication cables with shielding clamps provided at both ends to ensure the best possible high frequency cable contact.

If the ground potential between the frequency converter and the PLC is different, electric noise may occur that disturbs the entire system. Solve this problem by fitting an equalizing cable as close as possible to the control cable.

Minimum cable cross section: 16 mm² (6 AWG).

1	Minimum 16 mm ² (6 AWG)
2	Equalizing cable

Illustration 2.8 Shielding Clamps at Both Ends

50/60 Hz ground loops

With very long control cables, ground loops may occur. To eliminate ground loops, connect 1 end of the screen-to-ground with a 100 nF capacitor (keeping leads short).

Illustration 2.9 Connection with a 100 nF Capacitor

Avoid EMC noise on serial communication

This terminal is connected to ground via an internal RC link. Use twisted-pair cables to reduce interference between conductors. The recommended method is shown in *Illustration 2.10*.

1	Minimum 16 mm ² (6 AWG)
2	Equalizing cable

Illustration 2.10 Twisted-pair Cables

Alternatively, the connection to terminal 61 can be omitted.

1	Minimum 16 mm ² (6 AWG)
2	Equalizing cable

Illustration 2.11 Twisted-pair Cables without Terminal 61

2.3 Control Structures

2.3.1 Control Principle

A frequency converter rectifies AC voltage from mains into DC voltage. Then the DC voltage is converted into an AC current with a variable amplitude and frequency.

The motor is supplied with variable voltage/current and frequency, enabling infinitely variable speed control of 3-phased standard AC motors and permanent magnet synchronous motors.

2.3.2 Control Modes

The frequency converter is capable of controlling either the speed or the torque on the motor shaft. Setting *parameter 1-00 Configuration Mode* determines the type of control.

Speed control

There are 2 types of speed control:

- Speed open-loop control, which does not require any feedback from the motor (sensorless).
- Speed closed-loop PID control, which requires a speed feedback to an input. A properly optimized speed-closed loop control has higher accuracy than a speed open-loop control.

Select which input to use as speed PID feedback in *parameter 7-00 Speed PID Feedback Source*.

Torque control

The torque control function is used in applications where the torque on motor output shaft is controlling the application as tension control. Torque control can be selected in *parameter 1-00 Configuration Mode*. Torque setting is done by setting an analog, digital, or bus controlled reference. When running torque control, it is recommended to run a full AMA procedure, because correct motor data is important in achieving optimal performance.

- Closed loop in VVC⁺ mode. This function is used in applications with low to medium dynamic variation of shaft, and offers excellent performance in all 4 quadrants and at all motor speeds. The speed feedback signal is mandatory. It is recommended to use MCB102 option card. Ensure the encoder resolution is at least 1024 PPR, and the shield cable of the encoder is well grounded, because the accuracy of the speed feedback signal is important. Tune *parameter 7-06 Speed PID Lowpass Filter Time* to get the best speed feedback signal.
- Open loop in VVC⁺ mode. The function is used in mechanically robust applications, but the accuracy is limited. Open-loop torque function works for 2 directions. The torque is calculated on the basis of the internal current measurement in the frequency converter.

Speed/torque reference

The reference to these controls can be either a single reference or the sum of various references including relatively scaled references. Reference handling is explained in detail in *chapter 2.4 Reference Handling*.

2.3.3 FC 360 Control Principle

VLT® AutomationDrive FC 360 is a general-purpose frequency converter for variable speed applications. The control principle is based on Voltage Vector Control⁺.

0.37–22 kW (0.5–30 hp)

FC 360 0.37–22 kW (0.5–30 hp) frequency converters can handle asynchronous motors and permanent magnet synchronous motors up to 22 kW.

The current-sensing principle in FC 360 0.37–22 kW (0.5–30 hp) frequency converters is based on the current measurement by a resistor in the DC link. The ground fault protection and short-circuit behavior are handled by the same resistor.

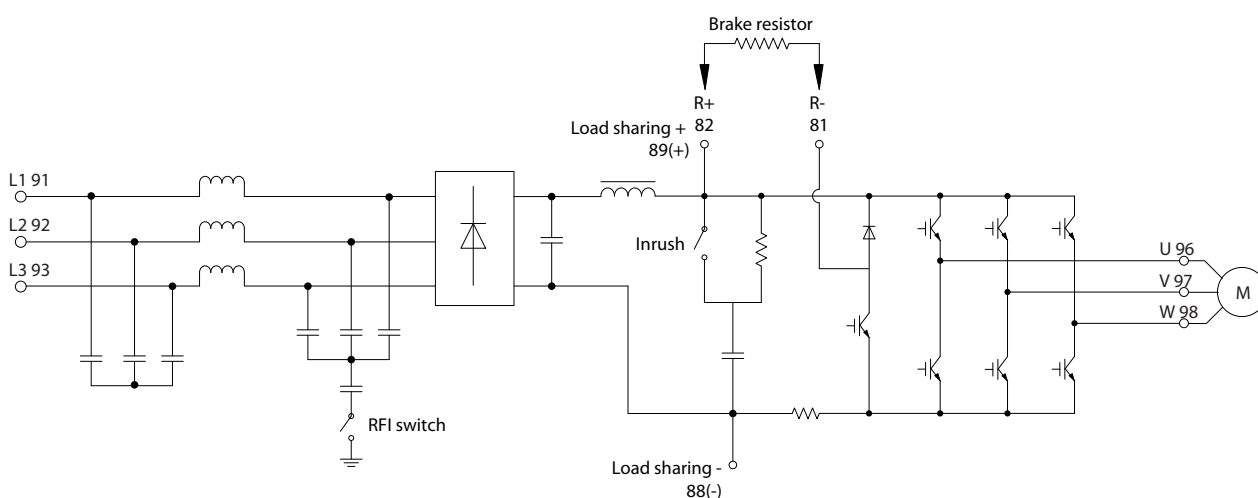

Illustration 2.12 Control Diagram for FC 360 0.37–22 kW (0.5–30 hp)

30–75 kW (40–100 hp)

FC 360 30–75 kW (40–100 hp) frequency converters can handle asynchronous motors only.

The current-sensing principle in FC 360 30–75 kW (40–100 hp) frequency converters is based on the current measurement in the motor phases.

The ground fault protection and short-circuit behavior on FC 360 30–75 kW (40–100 hp) frequency converters are handled by the 3 current transducers in the motor phases.

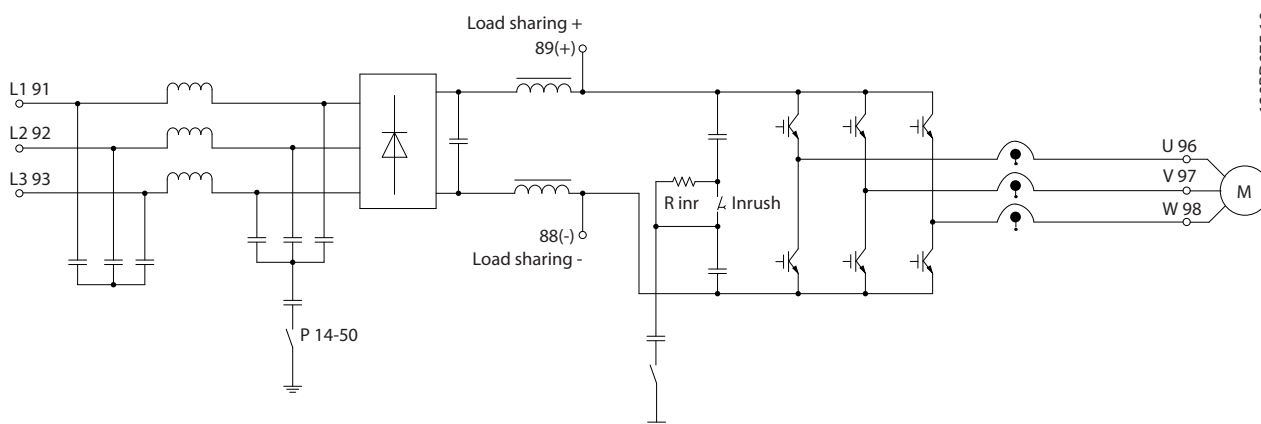

Illustration 2.13 Control Diagram for FC 360 30–75 kW (40–100 hp)

2

In the configuration shown in *Illustration 2.14*, *parameter 1-01 Motor Control Principle* is set to *[1] VVC⁺* and *parameter 1-00 Configuration Mode* is set to *[0] Speed open loop*. The resulting reference from the reference handling system is received and fed through the ramp limitation and speed limitation before being sent to the motor control. The output of the motor control is then limited by the maximum frequency limit.

Select [3] *Process* in *parameter 1-00 Configuration Mode* to use the process PID control for closed-loop control of speed or pressure in the controlled application. The process PID parameters are in *parameter groups 7-2* Process Ctrl. Feedb* and *7-3* Process PID Ctrl*.

2.3.5 Internal Current Control in VVC⁺ Mode

The frequency converter features an integral current limit control. This feature is activated when the motor current, and thus the torque, is higher than the torque limits set in *parameter 4-16 Torque Limit Motor Mode*, *parameter 4-17 Torque Limit Generator Mode*, and *parameter 4-18 Current Limit*.

When the frequency converter is at the current limit during motor operation or regenerative operation, the frequency converter tries to get below the preset torque limits as quickly as possible without losing control of the motor.

2.3.6 Local [Hand On] and Remote [Auto On] Control

Operate the frequency converter manually via the local control panel (LCP) or remotely via analog/digital inputs or fieldbus.

Start and stop the frequency converter pressing the [Hand On] and [Off/Reset] keys on the LCP. Set-up is required:

- *Parameter 0-40 [Hand on] Key on LCP.*
- *Parameter 0-44 [Off/Reset] Key on LCP.*
- *Parameter 0-42 [Auto on] Key on LCP.*

Reset alarms via the [Off/Reset] key or via a digital input, when the terminal is programmed to *Reset*.

Illustration 2.15 LCP Control Keys

Local reference forces the configuration mode to open loop, independent of the setting in *parameter 1-00 Configuration Mode*.

Local reference is restored at power-down.

2.4 Reference Handling

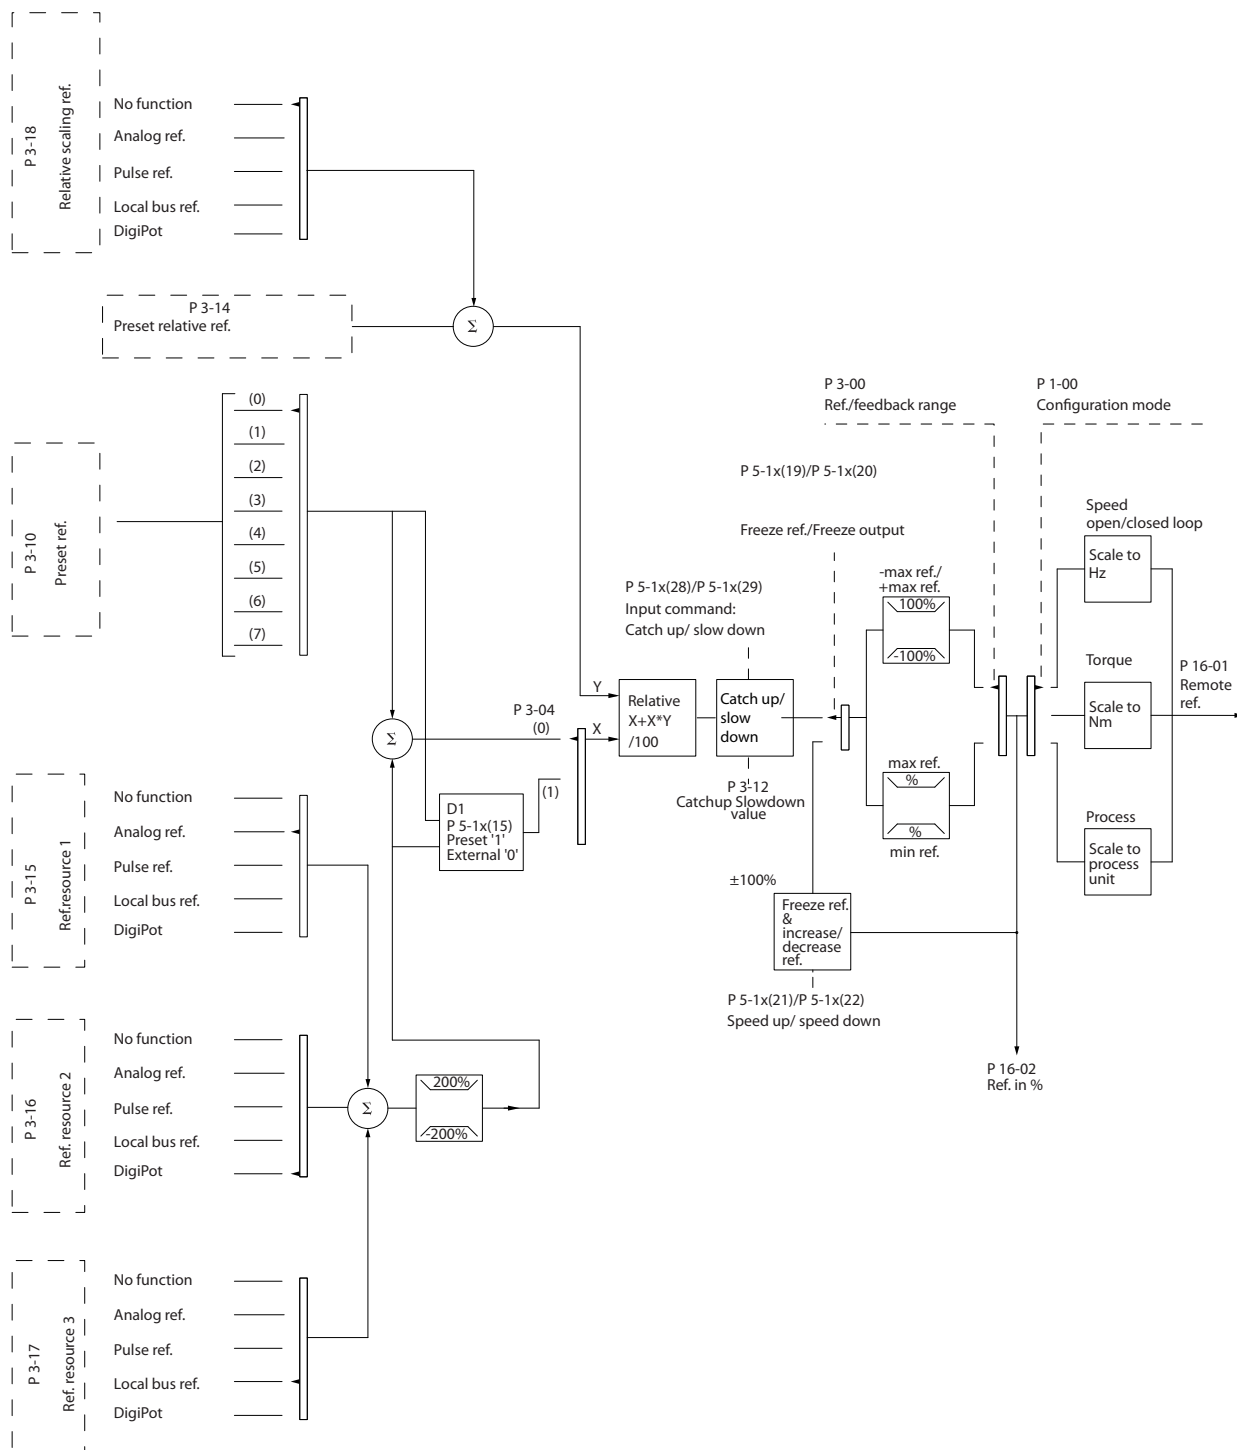

2

Local reference

The local reference is active when the frequency converter is operated with [Hand On] active. Adjust the reference by [▲]/[▼] and [←]/[→].

Remote reference

The reference handling system for calculating the remote reference is shown in *Illustration 2.16*.

130BD374.10

Illustration 2.16 Remote Reference

The remote reference is calculated once in every scan interval and initially consists of 2 types of reference inputs:

1. X (the external reference): A sum (see *parameter 3-04 Reference Function*) of up to 4 externally selected references, comprising any combination (determined by the setting of *parameter 3-15 Reference 1 Source*, *parameter 3-16 Reference 2 Source*, and *parameter 3-17 Reference 3 Source*) of a fixed preset reference (*parameter 3-10 Preset Reference*), variable analog references, variable digital pulse references, and various fieldbus references in any unit the frequency converter is monitoring ([Hz], [RPM], [Nm], and so on).
2. Y (the relative reference): A sum of 1 fixed preset reference (*parameter 3-14 Preset Relative Reference*) and 1 variable analog reference (*parameter 3-18 Relative Scaling Reference Resource*) in [%].

The 2 types of reference inputs are combined in the following formula:

Remote reference = $X + X \cdot Y / 100\%$.

If relative reference is not used, set *parameter 3-18 Relative Scaling Reference Resource* to [0] No function and *parameter 3-14 Preset Relative Reference* to 0%. The digital inputs on the frequency converter can activate both the catch up/slow down function and the freeze reference function. The functions and parameters are described in the *VLT® AutomationDrive FC 360 Programming Guide*.

The scaling of analog references is described in *parameter groups 6-1* Analog Input 53* and *6-2* Analog Input 54*, and the scaling of digital pulse references is described in *parameter group 5-5* Pulse Input*.

Reference limits and ranges are set in *parameter group 3-0* Reference Limits*.

2.4.1 Reference Limits

Parameter 3-00 Reference Range, *parameter 3-02 Minimum Reference*, and *parameter 3-03 Maximum Reference* define the allowed range of the sum of all references. The sum of all references is clamped when necessary. The relation between the resulting reference (after clamping) and the sum of all references are shown in *Illustration 2.17* and *Illustration 2.18*.

P 3-00 Reference Range = [0] Min-Max

Illustration 2.17 Sum of All References When Reference Range is Set to 0

P 3-00 Reference Range = [1] -Max-Max

Illustration 2.18 Sum of All References When Reference Range is Set to 1

The value of *parameter 3-02 Minimum Reference* cannot be set to less than 0, unless *parameter 1-00 Configuration Mode* is set to [3] Process. In that case, the following relations between the resulting reference (after clamping) and the sum of all references are as shown in *Illustration 2.19*.

P 3-00 Reference Range= [0] Min to Max

Illustration 2.19 Sum of All References When Minimum Reference is Set to a Minus Value

130BA186.11

2.4.3 Scaling of Analog and Pulse References and Feedback

References and feedback are scaled from analog and pulse inputs in the same way. The only difference is that a reference above or below the specified minimum and maximum endpoints (P1 and P2 in *Illustration 2.20*) are clamped while a feedback above or below is not.

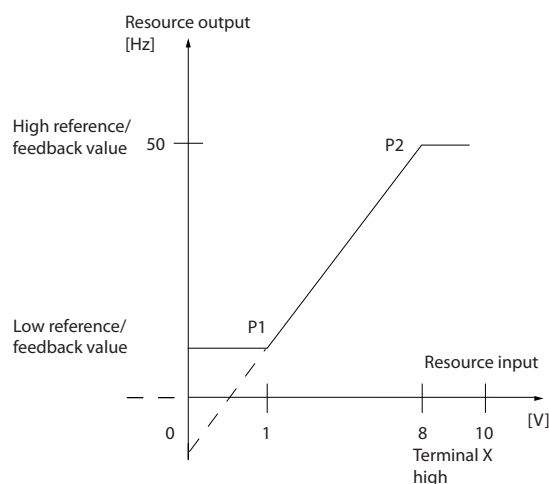

Illustration 2.20 Minimum and Maximum Endpoints

130BD431.10

2.4.2 Scaling of Preset References and Bus References

Preset references are scaled according to the following rules:

- When *parameter 3-00 Reference Range* is set to [0] *Min-Max*, 0% reference equals 0 [unit] where unit can be any unit, for example RPM, m/s, and bar. 100% reference equals the maximum (absolute value of *parameter 3-03 Maximum Reference*, absolute value of *parameter 3-02 Minimum Reference*).
- When *parameter 3-00 Reference Range* is set to [1] *-Max-+Max*, 0% reference equals 0 [unit], and 100% reference equals maximum reference.

Bus references are scaled according to the following rules:

- When *parameter 3-00 Reference Range* is set to [0] *Min-Max*, 0% reference equals minimum reference and 100% reference equals maximum reference.
- When *parameter 3-00 Reference Range* is set to [1] *-Max-+Max*, -100% reference equals -maximum reference, and 100% reference equals maximum reference.

The endpoints P1 and P2 are defined in Table 2.3 depending on choice of input.

Input	Analog 53 voltage mode	Analog 53 current mode	Analog 54 voltage mode	Analog 54 current mode	Pulse input 29	Pulse input 33
P1=(Minimum input value, Minimum reference value)						
Minimum reference value	Parameter 6-14 Terminal 53 Low Ref./Feedb. Value	Parameter 6-14 T erminal 53 Low Ref./Feedb. Value	Parameter 6-24 Terminal 54 Low Ref./Feedb. Value	Parameter 6-24 T erminal 54 Low Ref./Feedb. Value	Parameter 5-52 Term. 29 Low Ref./Feedb. Value	Parameter 5-57 Term. 33 Low Ref./Feedb. Value
Minimum input value	Parameter 6-10 Terminal 53 Low Voltage [V]	Parameter 6-12 T erminal 53 Low Current [mA]	Parameter 6-20 Terminal 54 Low Voltage [V]	Parameter 6-22 T erminal 54 Low Current [mA]	Parameter 5-50 Term. 29 Low Frequency [Hz]	Parameter 5-55 Term. 33 Low Frequency [Hz]
P2=(Maximum input value, Maximum reference value)

Table 2.3 P1 and P2 Endpoints

2.4.4 Dead Band Around Zero

Sometimes, the reference (in rare cases also the feedback) should have a dead band around 0 to ensure that the machine is stopped when the reference is near 0.

To make the dead band active and to set the amount of dead band, do the following:

- Set either the minimum reference value (see Table 2.3 for relevant parameter) or maximum reference value at 0. In other words, either P1 or P2 must be on the X-axis in Illustration 2.21.
- Ensure that both points defining the scaling graph are in the same quadrant.

P1 or P2 defines the size of the dead band as shown in Illustration 2.21.

Illustration 2.21 Size of Dead Band

Case 1: Positive reference with dead band, digital input to trigger reverse, part I

Illustration 2.22 shows how reference input with limits inside minimum to maximum limits clamps.

130BD454.10

Illustration 2.22 Clamping of Reference Input with Limits inside Minimum to Maximum

Case 2: Positive reference with dead band, digital input to trigger reverse, part II

Illustration 2.23 shows how reference input with limits outside -maximum to +maximum limits clamps to the input low and high limits before adding to external reference, and how the external reference is clamped to -maximum to +maximum by the reference algorithm.

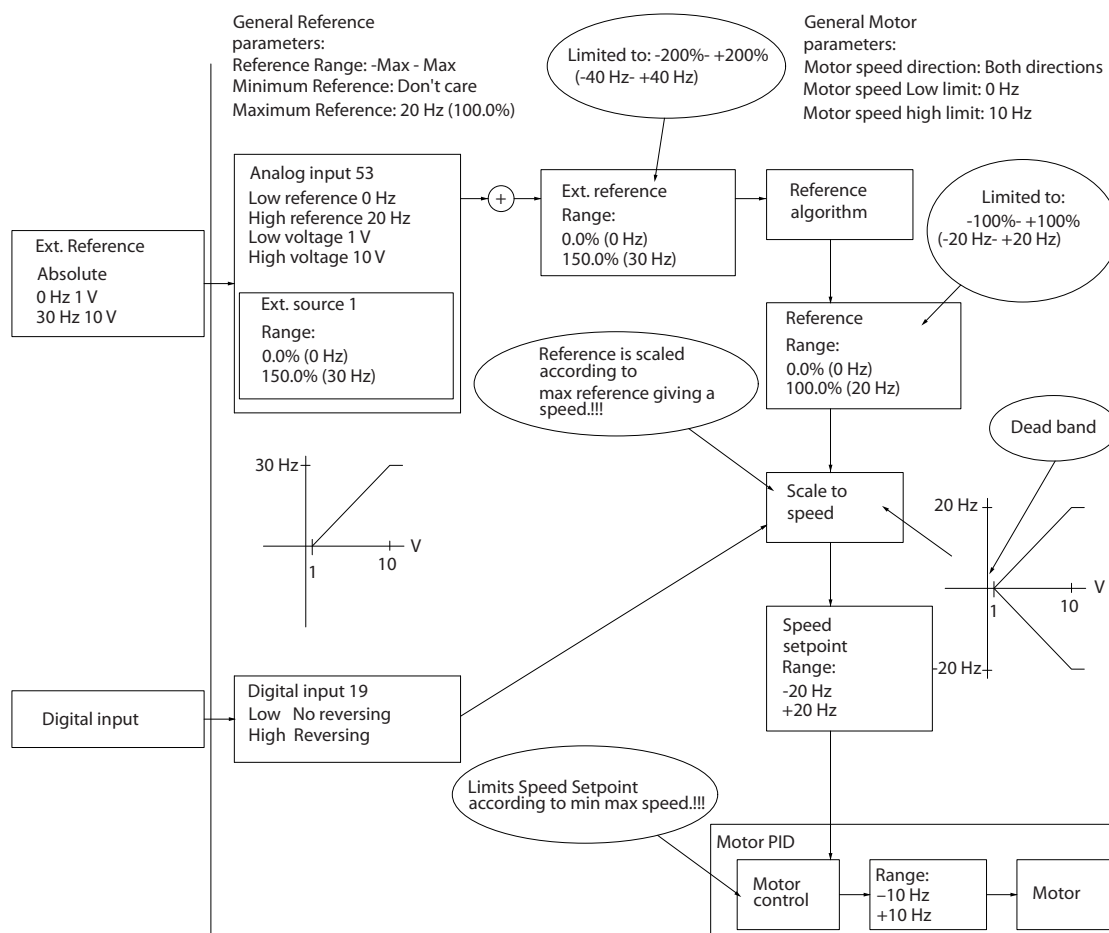

Illustration 2.23 Clamping of Reference Input with Limits outside -Maximum to +Maximum

2.5 PID Control

2.5.1 Speed PID Control

Parameter 1-00 Configuration Mode	Parameter 1-01 Motor Control Principle	
	U/f	VVC ⁺
[0] Speed open loop	Not active ¹⁾	Not active
[1] Speed closed loop	Not available ²⁾	ACTIVE
[2] Torque	Not available	Not active
[3] Process	Not active	Not active

Table 2.4 Control Configurations, Active Speed Control

1) Not active indicates that the specific mode is available, but the speed control is not active in that mode.

2) Not available indicates that the specific mode is not available at all.

Parameter	Description of function
Parameter 7-00 Speed PID Feedback Source	Select from which input the speed PID gets its feedback.
Parameter 7-02 Speed PID Proportional Gain	The higher the value, the quicker the control. However, too high a value may lead to oscillations.
Parameter 7-03 Speed PID Integral Time	Eliminates steady state speed error. Lower values mean quicker reaction. However, too low a value may lead to oscillations.
Parameter 7-04 Speed PID Differentiation Time	Provides a gain proportional to the rate of change of the feedback. A setting of 0 disables the differentiator.
Parameter 7-05 Speed PID Diff. Gain Limit	If there are quick changes in reference or feedback in a given application, which means that the error changes swiftly, the differentiator may soon become too dominant. This is because it reacts to changes in the error. The quicker the error changes, the stronger the differentiator gain is. The differentiator gain can thus be limited to allow setting of the reasonable differentiation time for slow changes and a suitably quick gain for quick changes.
Parameter 7-06 Speed PID Lowpass Filter Time	A low-pass filter that dampens oscillations on the feedback signal and improves steady state performance. However, too long a filter time deteriorates the dynamic performance of the speed PID control. Practical settings of <i>parameter 7-06 Speed PID Lowpass Filter Time</i> taken from the number of pulses per revolution from encoder (PPR):
	Encoder PPR
	Parameter 7-06 Speed PID Lowpass Filter Time
	512 10 ms
	1024 5 ms
	2048 2 ms
	4096 1 ms

Table 2.5 Speed Control Parameters

Example of programming the speed control

In this example, the speed PID control is used to maintain a constant motor speed regardless of the changing load on the motor. The required motor speed is set via a potentiometer connected to terminal 53. The speed range is 0–1500 RPM corresponding to 0–10 V over the potentiometer. A switch connected to terminal 18 controls starting and stopping. The speed PID monitors the actual RPM of the motor by using a 24 V (HTL) incremental encoder as feedback. The feedback sensor is an encoder (1024 pulses per revolution) connected to terminals 32 and 33. The pulse frequency range to terminals 32 and 33 is 4 Hz–32 kHz.

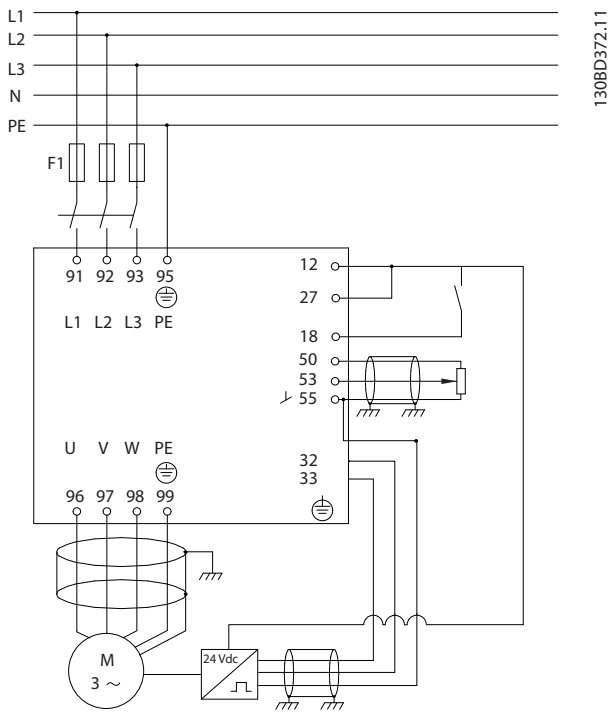

Illustration 2.24 Speed Control Programming

Follow the steps in *Table 2.6* to program the speed control (see explanation of settings in the *programming guide*)
In *Table 2.6*, it is assumed that all other parameters and switches remain at their default setting.

Function	Parameter number	Setting
1) Make sure that the motor runs properly. Do the following:		
Set the motor parameters using the data on the nameplate.	<i>Parameter group 1-2*</i> <i>Motor Data</i>	As specified by motor nameplate.
Perform an AMA.	<i>Parameter 1-29 Automatic</i> <i>Motor Adaption (AMA)</i>	[1] Enable complete AMA
2) Check that the motor is running and that the encoder is attached properly. Do the following:		
Press [Hand On]. Check that the motor is running and note the rotation direction (referred to as the positive direction).		Set a positive reference.
3) Make sure that the frequency converter limits are set to safe values:		
Set acceptable limits for the references.	<i>Parameter 3-02 Minimum</i> <i>Reference</i>	0
	<i>Parameter 3-03 Maximum</i> <i>Reference</i>	50
Check that the ramp settings are within frequency converter capabilities and allowed application operating specifications.	<i>Parameter 3-41 Ramp 1</i> <i>Ramp Up Time</i>	Default setting
	<i>Parameter 3-42 Ramp 1</i> <i>Ramp Down Time</i>	Default setting
Set acceptable limits for the motor speed and frequency.	<i>Parameter 4-12 Motor</i> <i>Speed Low Limit [Hz]</i>	0 Hz
	<i>Parameter 4-14 Motor</i> <i>Speed High Limit [Hz]</i>	50 Hz
	<i>Parameter 4-19 Max</i> <i>Output Frequency</i>	60 Hz
4) Configure the speed control and select the motor control principle:		
Activation of speed control	<i>Parameter 1-00 Configu-</i> <i>ration Mode</i>	[1] Speed closed loop
Selection of motor control principle	<i>Parameter 1-01 Motor</i> <i>Control Principle</i>	[1] VVC ⁺
5) Configure and scale the reference to the speed control:		
Set up analog input 53 as a reference source.	<i>Parameter 3-15 Reference 1</i> <i>Source</i>	Not necessary (default)
Scale analog input 53 0 Hz (0 V) to 50 Hz (10 V)	<i>Parameter group 6-1*</i> <i>Analog Input 1</i>	Not necessary (default)
6) Configure the 24 V HTL encoder signal as feedback for the motor control and the speed control:		
Set up digital input 32 and 33 as encoder inputs.	<i>Parameter 5-14 Terminal</i> <i>32 Digital Input</i>	[82] Encoder input B
	<i>Parameter 5-15 Terminal</i> <i>33 Digital Input</i>	[83] Encoder input A
Select terminal 32/33 as speed PID feedback.	<i>Parameter 7-00 Speed PID</i> <i>Feedback Source</i>	[1] 24 V Encoder
7) Tune the speed control PID parameters:		
Use the tuning guidelines when relevant or tune manually.	<i>Parameter group 7-0*</i> <i>Speed PID Ctrl.</i>	
8) Finish:		
Save the parameter setting to the LCP for safe-keeping.	<i>Parameter 0-50 LCP Copy</i>	[1] All to LCP

Table 2.6 Programming Order for Speed PID Control

2.5.2 Process PID Control

The process PID control can be used to control application parameters that can be measured by a sensor (for example pressure, temperature, flow) and affected by the connected motor through a pump, fan, or other connected devices.

Table 2.7 shows the control configurations in which the process control is possible. Refer to *chapter 2.3 Control Structures* to see where the speed control is active.

Parameter 1-00 Configuration Mode	Parameter 1-01 Motor Control Principle	
	U/f	VVC+
[3] Process	Not available	Process

Table 2.7 Control Configuration

NOTICE

The process control PID works under the default parameter setting, but tuning the parameters is recommended to optimize the application control performance.

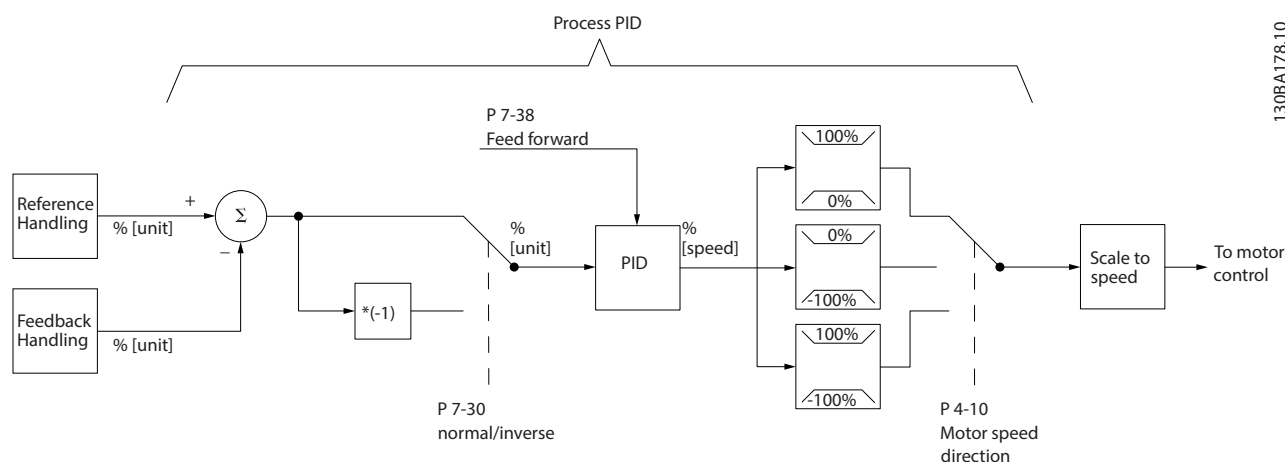

Illustration 2.25 Process PID Control Diagram

2.5.3 Process Control Relevant Parameters

2

Parameter	Description of function
<i>Parameter 7-20 Process CL Feedback 1 Resource</i>	Select from which source (analog or pulse input) the process PID gets its feedback.
<i>Parameter 7-22 Process CL Feedback 2 Resource</i>	Optional: Determine if (and from where) the process PID gets an additional feedback signal. If an additional feedback source is selected, the 2 feedback signals are added before being used in the process PID control.
<i>Parameter 7-30 Process PID Normal/ Inverse Control</i>	Under <i>[0] Normal</i> operation, the process control responds with an increase of the motor speed if the feedback is lower than the reference. Under <i>[1] Inverse</i> operation, the process control responds with a decreasing motor speed instead.
<i>Parameter 7-31 Process PID Anti Windup</i>	The anti-windup function ensures that when either a frequency limit or a torque limit is reached, the integrator is set to a gain that corresponds to the actual frequency. This avoids integrating on an error that cannot be compensated for by a speed change. Press <i>[0] Off</i> to disable this function.
<i>Parameter 7-32 Process PID Start Speed</i>	In some applications, reaching the required speed/setpoint can take a long time. In such applications, it may be an advantage to set a fixed motor speed from the frequency converter before the process control is activated. Set a fixed motor speed by setting a process PID start value (speed) in <i>parameter 7-32 Process PID Start Speed</i> .
<i>Parameter 7-33 Process PID Proportional Gain</i>	The higher the value, the quicker the control. However, too large a value may lead to oscillations.
<i>Parameter 7-34 Process PID Integral Time</i>	Eliminates steady state speed error. A lower value means a quicker reaction. However, too small a value may lead to oscillations.
<i>Parameter 7-35 Process PID Differentiation Time</i>	Provides a gain proportional to the rate of feedback change. A setting of 0 disables the differentiator.
<i>Parameter 7-36 Process PID Diff. Gain Limit</i>	If there are quick changes in reference or feedback in a given application (which means that the error changes swiftly), the differentiator may soon become too dominant. This is because it reacts to changes in the error. The quicker the error changes, the stronger the differentiator gain is. The differentiator gain can thus be limited to allow setting of the reasonable differentiation time for slow changes.
<i>Parameter 7-38 Process PID Feed Forward Factor</i>	In applications where there is a good (and approximately linear) correlation between the process reference and the motor speed necessary for obtaining that reference, use the feed-forward factor to achieve better dynamic performance of the process PID control.
<ul style="list-style-type: none"> <i>Parameter 6-16 Terminal 53 Filter Time Constant (Analog term 53)</i> <i>Parameter 6-26 Terminal 54 Filter Time Constant (Analog term. 54)</i> 	<p>If there are oscillations of the current/voltage feedback signal, use a low-pass filter to dampen these oscillations.</p> <p>Example: If the low-pass filter has been set to 0.1 s, the limit speed is 10 RAD/s (the reciprocal of 0.1 s), corresponding to $(10/(2 \times \pi))=1.6$ Hz. This means that the filter dampens all currents/voltages that vary by more than 1.6 oscillations per second. The control is only carried out on a feedback signal that varies by a frequency (speed) of less than 1.6 Hz.</p> <p>The low-pass filter improves steady state performance, but selecting a too long filter time deteriorates the dynamic performance of the process PID control.</p>

Table 2.8 Process Control Parameters

2.5.4 Example of Process PID Control

Illustration 2.26 is an example of a process PID control used in a ventilation system:

Illustration 2.26 Process PID Control in a Ventilation System

In a ventilation system, the temperature can be set from -5 to +35 °C (23–95 °F) with a potentiometer of 0–10 V. To keep the set temperature constant, use the process control.

The control is inverse, which means that when the temperature increases, the ventilation speed is increased as well to generate more air. When the temperature drops, the speed is reduced. The transmitter used is a temperature sensor with a working range of -10 to +40 °C (14–104 °F), 4–20 mA.

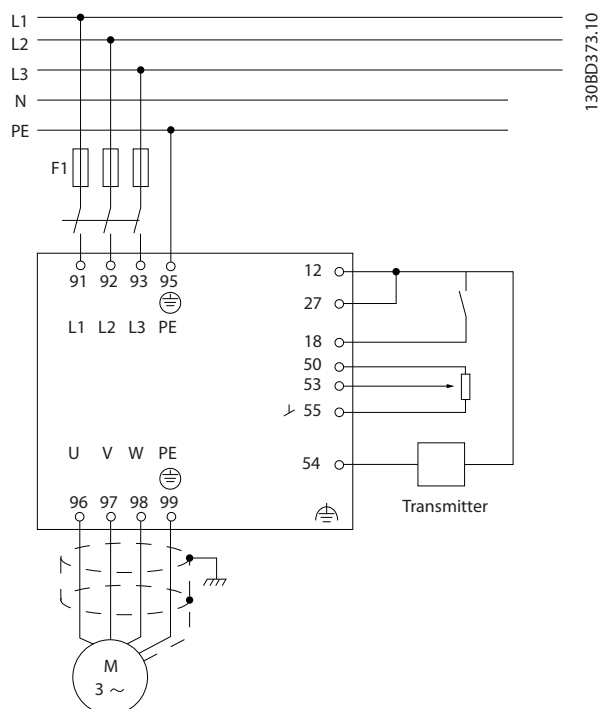

Illustration 2.27 2-wire Transmitter

1. Start/stop via the switch connected to terminal 18.
2. Temperature reference via potentiometer (-5 to +35 °C (23–95 °F), 0–10 V DC) connected to terminal 53.
3. Temperature feedback via transmitter (-10 to +40 °C (14–104 °F), 4–20 mA) connected to terminal 54.

Function	Parameter number	Setting
Initialize the frequency converter.	<i>Parameter 14-2 2 Operation Mode</i>	[2] Initialisation - perform a power cycling - press reset.
1) Set motor parameters:		
Set the motor parameters according to nameplate data.	<i>Parameter group 1-2* Motor Data</i>	As stated on motor nameplate.
Perform a full AMA.	<i>Parameter 1-29 Automatic Motor Adaption (AMA)</i>	[1] Enable complete AMA.
2) Check that motor is running in the correct direction. When the motor is connected to the frequency converter with straight forward phase order as U-U; V-V; W-W, the motor shaft usually turns clockwise seen into shaft end.		
Press [Hand On]. Check the shaft direction by applying a manual reference.		
If the motor turns opposite of required direction: 1. Change motor direction in <i>parameter 4-10 Motor Speed Direction</i> . 2. Turn off mains, and wait for DC link to discharge. 3. Switch 2 of the motor phases.	<i>Parameter 4-10 Motor Speed Direction</i>	Select correct motor shaft direction.
Set configuration mode.	<i>Parameter 1-00 Configuration Mode</i>	[3] Process.
3) Set reference configuration, that is the range for reference handling. Set scaling of analog input in <i>parameter group 6-** Analog In/Out</i> .		
Set reference/feedback units. Set minimum reference (10 °C (50 °F)). Set maximum reference (80 °C (176 °F)). If the set value is determined from a preset value (array parameter), set other reference sources to [0] No Function.	<i>Parameter 3-01 Reference/ Feedback Unit Parameter 3-02 Minimum Reference Parameter 3-03 Maximum Reference Parameter 3-10 Preset Reference</i>	[60] °C Unit shown on display. -5 °C (23 °F). 35 °C (95 °F). [0] 35%. $Ref = \frac{Par. 3 - 10_{[0]}}{100} \times ((Par. 3 - 03) - (par. 3 - 02)) = 24,5^{\circ}C$ Parameter 3-14 Preset Relative Reference to parameter 3-18 Relative Scaling Reference Resource [0] = No Function.
4) Adjust limits for the frequency converter:		
Set ramp times to an appropriate value as 20 s.	<i>Parameter 3-41 Ramp 1 Ramp Up Time Parameter 3-42 Ramp 1 Ramp Down Time</i>	20 s 20 s

Function	Parameter number	Setting
Set minimum speed limits.	<i>Parameter 4-12</i>	10 Hz
Set motor speed maximum limit.	<i>Motor Speed</i>	50 Hz
Set maximum output frequency.	<i>Low Limit [Hz]</i>	60 Hz
	<i>Parameter 4-14</i>	
	<i>Motor Speed</i>	
	<i>High Limit [Hz]</i>	
	<i>Parameter 4-19</i>	
	<i>Max Output</i>	
	<i>Frequency</i>	
Set <i>parameter 6-19 Terminal 53 mode</i> and <i>parameter 6-29 Terminal 54 mode</i> to voltage or current mode.		
5) Scale analog inputs used for reference and feedback:		
Set terminal 53 low voltage.	<i>Parameter 6-10</i>	0 V
Set terminal 53 high voltage.	<i>Terminal 53</i>	10 V
Set terminal 54 low feedback value.	<i>Low Voltage</i>	-5 °C (23 °F)
Set terminal 54 high feedback value.	<i>Parameter 6-11</i>	35 °C (95 °F)
Set feedback source.	<i>Terminal 53</i>	[2] Analog input 54
	<i>High Voltage</i>	
	<i>Parameter 6-24</i>	
	<i>Terminal 54</i>	
	<i>Low Ref./Feedb. Value</i>	
	<i>Parameter 6-25</i>	
	<i>Terminal 54</i>	
	<i>High Ref./Feedb. Value</i>	
	<i>Parameter 7-20</i>	
	<i>Process CL</i>	
	<i>Feedback 1</i>	
	<i>Resource</i>	
6) Basic PID settings:		
Process PID normal/inverse.	<i>Parameter 7-30</i>	[0] Normal
	<i>Process PID</i>	
	<i>Normal/</i>	
	<i>Inverse Control</i>	
Process PID anti wind-up.	<i>Parameter 7-31</i>	[1] On
	<i>Process PID</i>	
	<i>Anti Windup</i>	
Process PID start speed.	<i>Parameter 7-32</i>	300 RPM
	<i>Process PID</i>	
	<i>Start Speed</i>	
Save parameters to LCP.	<i>Parameter 0-50</i>	[1] All to LCP
	<i>LCP Copy</i>	

Table 2.9 Example of Process PID Control Set-up

2

2.5.5 Process Controller Optimization

After configuring the basic settings as described in *chapter 2.5.5 Programming Order*, optimize the proportional gain, the integration time, and the differentiation time (*parameter 7-33 Process PID Proportional Gain*, *parameter 7-34 Process PID Integral Time*, and *parameter 7-35 Process PID Differentiation Time*). In most processes, complete the following procedure:

1. Start the motor.
2. Set *parameter 7-33 Process PID Proportional Gain* to 0.3 and increase it until the feedback signal again begins to vary continuously. Reduce the value until the feedback signal has stabilized. Lower the proportional gain by 40–60%.
3. Set *parameter 7-34 Process PID Integral Time* to 20 s and reduce the value until the feedback signal again begins to vary continuously. Increase the integration time until the feedback signal stabilizes, followed by an increase of 15–50%.
4. Only use *parameter 7-35 Process PID Differentiation Time* for fast-acting systems (differentiation time). The typical value is 4 times the set integration time. Use the differentiator when the setting of the proportional gain and the integration time has been fully optimized. Make sure that the low-pass filter dampens the oscillations on the feedback signal sufficiently.

NOTICE

If necessary, start/stop can be activated several times to provoke a variation of the feedback signal.

2.5.6 Ziegler Nichols Tuning Method

To tune the PID controls of the frequency converter, Danfoss recommends the Ziegler Nichols tuning method.

NOTICE

Do not use the Ziegler Nichols Tuning method in applications that could be damaged by the oscillations created by marginally stable control settings.

The criteria for adjusting the parameters are based on evaluating the system at the limit of stability rather than on taking a step response. Increase the proportional gain until observing continuous oscillations (as measured on the feedback), that is, until the system becomes marginally stable. The corresponding gain (K_u) is called the ultimate gain and is the gain, at which the oscillation is obtained. The period of the oscillation (P_u) (called the ultimate period) is determined as shown in *Illustration 2.28* and should be measured when the amplitude of oscillation is small.

1. Select only proportional control, meaning that the integral time is set to the maximum value, while the differentiation time is set to 0.
2. Increase the value of the proportional gain until the point of instability is reached (sustained oscillations) and the critical value of gain, K_u , is reached.
3. Measure the period of oscillation to obtain the critical time constant, P_u .
4. Use *Table 2.10* to calculate the necessary PID control parameters.

The process operator can do the final tuning of the control iteratively to yield satisfactory control.

Illustration 2.28 Marginally Stable System

Type of control	Proportional gain	Integral time	Differentiation time
PI-control	$0.45 \times K_u$	$0.833 \times P_u$	–
PID tight control	$0.6 \times K_u$	$0.5 \times P_u$	$0.125 \times P_u$
PID some overshoot	$0.33 \times K_u$	$0.5 \times P_u$	$0.33 \times P_u$

Table 2.10 Ziegler Nichols Tuning for Regulator

2.6 EMC Emission and Immunity

2.6.1 General Aspects of EMC Emission

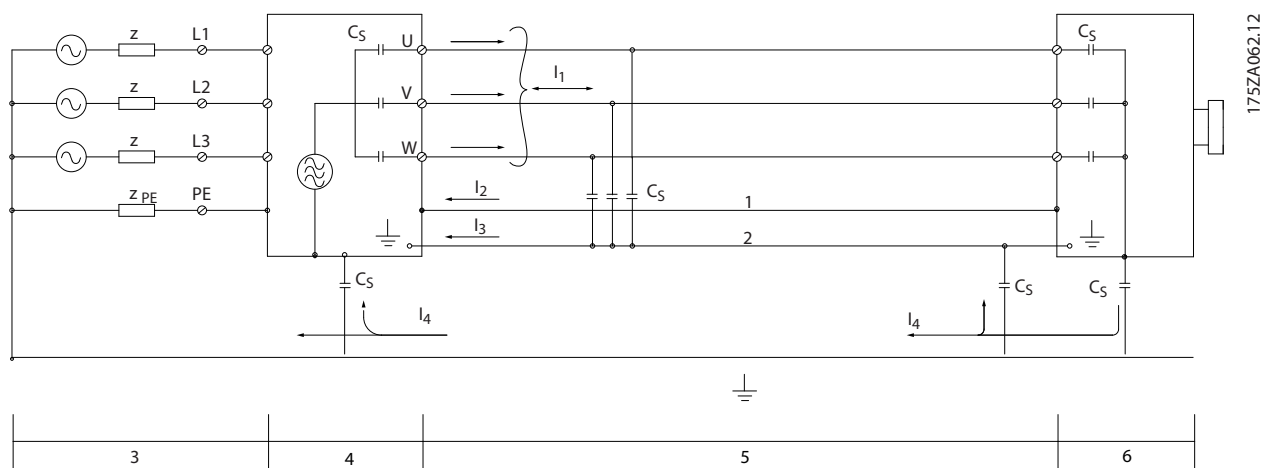

Electrical interference is conducted at frequencies in the range 150 kHz to 30 MHz. Airborne interference from the frequency converter system in the range 30 MHz to 1 GHz is generated from the frequency converter, motor cable, and motor. Capacitive currents in the motor cable coupled with a high dU/dt from the motor voltage generate leakage currents. Using a shielded motor cable increases the leakage current (see *Illustration 2.29*) because shielded cables have higher capacitance to ground than unshielded cables. If the leakage current is not filtered, it causes greater interference on the mains in the radio frequency range below approximately 5 MHz. Since the leakage current (I_1) is carried back to the unit through the shield (I_3), there is only a small electro-magnetic field (I_4) from the shielded motor cable.

The shield reduces the radiated interference but increases the low-frequency interference on the mains. Connect the motor cable shield to the frequency converter enclosure and the motor enclosure. This is best done by using integrated shield clamps to avoid twisted shield ends (pigtails). The shield clamps increase the shield impedance at higher frequencies, which reduces the shield effect and increases the leakage current (I_4).

Mount the shield on the enclosure at both ends if a shielded cable is used for the following purposes:

- Fieldbus
- Network
- Relay
- Control cable
- Signal interface
- Brake

In some situations, however, it is necessary to break the shield to avoid current loops.

1	Ground cable
2	Shield
3	AC mains supply
4	Frequency converter
5	Shielded motor cable
6	Motor

Illustration 2.29 EMC Emission

2

If placing the shield on a mounting plate for the frequency converter, use a metal mounting plate to convey the shield currents back to the unit. Ensure good electrical contact from the mounting plate through the mounting screws to the frequency converter chassis.

When using unshielded cables, some emission requirements are not complied with, although the immunity requirements are observed.

To reduce the interference level from the entire system (unit and installation), make motor and brake cables as short as possible. Avoid placing cables with a sensitive signal level alongside mains, motor, and brake cables. Radio interference higher than 50 MHz (airborne) is especially generated by the control electronics.

2.6.2 EMC Emission Requirements

The test results in *Table 2.11* have been obtained using a system with a frequency converter (with the mounting plate), a motor, and shielded motor cables.

		Enclosure size and rated power	Class A Group 2/EN 55011 Industrial environment		Class A Group 1/EN 55011 Industrial environment	
			Category C3/EN/IEC 61800-3 Second environment		Category C2/EN/IEC 61800-3 First environment restricted	
			Conducted	Radiated	Conducted	Radiated
A1 Filter	J1	0.37–2.2 kW (0.5–3.0 hp), 380–480 V	–	–	25 m (82 ft)	Yes
	J2	3.0–5.5 kW (4.0–7.5 hp), 380–480 V	–	–	25 m (82 ft)	Yes
	J3	7.5 kW (10 hp), 380–480 V	–	–	25 m (82 ft)	Yes
	J4	11–15 kW (15–20 hp), 380–480 V	–	–	25 m (82 ft)	Yes
	J5	18.5–22 kW (25–30 hp), 380–480 V	–	–	25 m (82 ft)	Yes
A2 Filter	J1	0.37–2.2 kW (0.5–3.0 hp), 380–480 V	5 m (16.4 ft)	Yes ¹⁾	–	–
	J2	3.0–5.5 kW (4.0–7.5 hp), 380–480 V	5 m (16.4 ft)	Yes ¹⁾	–	–
	J3	7.5 kW (10 hp), 380–480 V	5 m (16.4 ft)	Yes ¹⁾	–	–
	J4	11–15 kW (15–20 hp), 380–480 V	5 m (16.4 ft)	Yes ¹⁾	–	–
	J5	18.5–22 kW (25–30 hp), 380–480 V	5 m (16.4 ft)	Yes ¹⁾	–	–
	J6	30–45 kW (40–60 hp), 380–480 V	25 m (82 ft)	Yes ¹⁾	–	–
	J7	55–75 kW (75–100 hp), 380–480 V	25 m (82 ft)	Yes ¹⁾	–	–

Table 2.11 EMC Emission (Filter Type: Internal)

1) Frequency range from 150 kHz to 30 MHz is not harmonized between IEC/EN 61800-3 and EN 55011 and not mandatorily included.

2.6.3 EMC Immunity Requirements

The immunity requirements for frequency converters depend on the environment in which they are installed. The requirements for the industrial environment are higher than the requirements for the home and office environment. All Danfoss frequency converters comply with the requirements for the industrial environment. Therefore they also comply with the lower requirements for home and office environment with a large safety margin.

To document immunity against burst transient from electrical phenomena, the following immunity tests have been made on a system consisting of:

- A frequency converter (with options if relevant).
- A shielded control cable.
- A control box with potentiometer, motor cable, and motor.

The tests were performed in accordance with the following basic standards:

- **EN 61000-4-2 (IEC 61000-4-2) Electrostatic discharges (ESD):** Simulation of electrostatic discharges from human beings.
- **EN 61000-4-3 (IEC 61000-4-3) Radiated immunity:** Amplitude modulated simulation of the effects of radar and radio communication equipment and mobile communications equipment.
- **EN 61000-4-4 (IEC 61000-4-4) Burst transients:** Simulation of interference caused by switching a contactor, relay, or similar devices.
- **EN 61000-4-5 (IEC 61000-4-5) Surge transients:** Simulation of transients caused by, for example, lightning that strikes near installations.
- **EN 61000-4-6 (IEC 61000-4-6) Conducted immunity:** Simulation of the effect from radio-transmission equipment joined by connection cables.

The immunity requirements should follow product standard IEC 61800-3. See *Table 2.12* for details.

Voltage range: 380–480 V					
Product standard	61800-3				
Test	ESD	Radiated immunity	Burst	Surge	Conducted immunity
Acceptance criterion	B	B	B	A	A
Mains cable	–	–	2 kV CN	2 kV/2 Ω DM 2 kV/12 Ω CM	10 V _{RMS}
Motor cable	–	–	4 kV CCC	–	10 V _{RMS}
Brake cable	–	–	4 kV CCC	–	10 V _{RMS}
Load sharing cable	–	–	4 kV CCC	–	10 V _{RMS}
Relay cable	–	–	4 kV CCC	–	10 V _{RMS}
Control cable	–	–	Length >2 m (6.6 ft) 1 kV CCC	Unshielded: 1 kV/42 Ω CM	10 V _{RMS}

AD: Air discharge

DM: Differential mode

CM: Common mode

CN: Direct injection through coupling network

CCC: Injection through capacitive coupling clamp

2

2.7 Galvanic Isolation

PELV offers protection through extra low voltage. Protection against electric shock is ensured when the electrical supply is of the PELV type and the installation is made as described in local/national regulations on PELV supplies.

All control terminals and relay terminals 01-03/04-06 comply with PELV (Protective Extra Low Voltage). This does not apply to grounded Delta leg above 400 V.

Galvanic (ensured) isolation is obtained by fulfilling requirements for higher isolation and by providing the relevant creepage/clearance distances. These requirements are described in the EN 61800-5-1 standard.

The components that make up the electrical isolation, as shown in *Illustration 2.30*, also comply with the requirements for higher isolation and the relevant test as described in EN 61800-5-1.

The PELV galvanic isolation can be shown in 3 locations (see *Illustration 2.30*):

To maintain PELV, all connections made to the control terminals must be PELV, e.g. thermistor must be reinforced/double insulated.

1	Power supply (SMPS) for control cassette
2	Communication between power card and control cassette
3	Customer relays

Illustration 2.30 Galvanic Isolation

Interface between Standard RS485 and I/O circuit (PELV) is functionally isolated.

⚠ WARNING

Before touching any electrical parts, ensure that other voltage inputs have been disconnected, such as load sharing (linkage of DC intermediate circuit) and the motor connection for kinetic back-up. Wait at least the amount of time indicated in *Table 1.2*. Failure to follow recommendations could result in death or serious injury.

2.8 Earth Leakage Current

Follow national and local codes regarding protective grounding of equipment with a leakage current >3.5 mA. Frequency converter technology implies high frequency switching at high power. This generates a leakage current in the ground connection. A fault current in the frequency converter at the output power terminals might contain a DC component, which can charge the filter capacitors and cause a transient ground current.

The earth leakage current is made up of several contributions and depends on various system configurations including RFI filtering, shielded motor cables, and frequency converter power.

Illustration 2.31 Influence of the Cable Length and Power Size on Leakage Current, $P_a > P_b$

The leakage current also depends on the line distortion.

Illustration 2.32 Influence of Line Distortion on Leakage Current

NOTICE

High leakage current may cause the RCDs to switch off. To avoid this problem, remove the RFI screw (enclosure sizes J1 to J5) or set *parameter 14-50 RFI Filter* to [0] Off (enclosure sizes J6 and J7) when a filter is being charged.

EN/IEC61800-5-1 (Power Drive System Product Standard) requires special care if the leakage current exceeds 3.5mA. Grounding must be reinforced in 1 of the following ways:

- Ground wire (terminal 95) of at least 10 mm².
- 2 separate ground wires that comply with the dimensioning rules.

See EN/IEC61800-5-1 for further information.

Using RCDs

Where residual current devices (RCDs), also known as earth leakage circuit breakers (ELCBs), are used, comply with the following:

- Use RCDs of type B only, which are capable of detecting AC and DC currents.
- Use RCDs with an inrush delay to prevent faults caused by transient earth currents.
- Dimension RCDs according to the system configuration and environmental considerations.

Illustration 2.33 Main Contributions to Leakage Current

Illustration 2.34 Influence of Cut-off Frequency of the RCD on What is Responded to/Measured

For more details, refer to the *RCD Application Note*.

2.9 Brake Functions

2.9.1 Mechanical Holding Brake

A mechanical holding brake mounted directly on the motor shaft normally performs static braking.

NOTICE

When the holding brake is included in a safety chain, a frequency converter cannot provide a safe control of a mechanical brake. Include a redundancy circuitry for the brake control in the total installation.

2.9.2 Dynamic Braking

Dynamic braking is established by:

- Resistor brake: A brake IGBT keeps the overvoltage under a certain threshold by directing the brake energy from the motor to the connected brake resistor (*parameter 2-10 Brake Function = [1] Resistor brake*).
Adjust the threshold in *parameter 2-14 Brake voltage reduce*, with 70 V range.
- AC brake: The brake energy is distributed in the motor by changing the loss conditions in the motor. The AC brake function cannot be used in applications with high cycling frequency as this overheats the motor (*parameter 2-10 Brake Function = [2] AC brake*).
- DC brake: An overmodulated DC current added to the AC current works as an eddy current brake (*parameter 2-02 DC Braking Time* ≠ 0 s).

2.9.3 Brake Resistor Selection

To handle higher demands by generatoric braking, a brake resistor is necessary. Using a brake resistor ensures that the heat is absorbed in the brake resistor and not in the frequency converter. For more information, see the VLT® Brake Resistor MCE 101 Design Guide.

If the amount of kinetic energy transferred to the resistor in each braking period is not known, the average power can be calculated based on the cycle time and braking time. The resistor intermittent duty cycle is an indication of the duty cycle at which the resistor is active. *Illustration 2.35* shows a typical braking cycle.

The intermittent duty cycle for the resistor is calculated as follows:

$$\text{Duty cycle} = t_b / T$$

t_b is the braking time in seconds

T = cycle time in seconds.

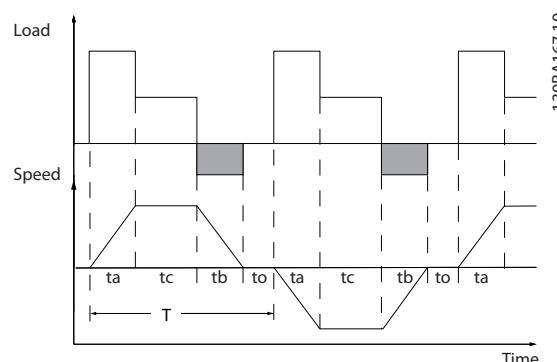

Illustration 2.35 Typical Braking Cycle

Power range	0.37–75 kW (0.5–100 hp) ¹⁾
380–480 V	
Cycle time (s)	120
Braking duty cycle at 100% torque	Continuous
Braking duty cycle at overtorque (150/160%)	40%

Table 2.13 Braking at High Overload Torque Level

1) For 30–75 kW (40–100 hp) frequency converters, an external brake resistor is needed to meet the specification in Table 2.13.

Danfoss offers brake resistors with duty cycle of 10% and 40%. If a 10% duty cycle is applied, the brake resistors are able to absorb brake power for 10% of the cycle time. The remaining 90% of the cycle time is used for dissipating excess heat.

NOTICE

Make sure that the resistor is designed to handle the required braking time.

The maximum allowed load on the brake resistor is stated as a peak power at a given intermittent duty cycle and can be calculated as:

Brake Resistance Calculation

$$R_{br} [\Omega] = \frac{U_{dc,br}^2 \times 0.83}{P_{peak}}$$

where

$$P_{peak} = P_{motor} \times M_{br} [\%] \times \eta_{motor} \times \eta_{VLT} [W]$$

As can be seen, the brake resistor depends on the DC-link voltage (U_{dc}).

Size	Brake active $U_{dc,br}$	Warning before cut out	Cut out (trip)
FC 360 3x380–480 V	770 V	800 V	800 V

The threshold can be adjusted in *parameter 2-14 Brake voltage reduce*, with 70 V range.

NOTICE

Make sure that the brake resistor can cope with a voltage of 410 V or 820 V.

Danfoss recommends calculating the brake resistance R_{rec} according to the formula below. The recommended brake resistance guarantees that the frequency converter is able to brake at the highest braking torque ($M_{br}(\%)$) of 160%.

$$R_{rec} [\Omega] = \frac{U_{dc}^2 \times 100 \times 0.83}{P_{motor} \times M_{br}(\%) \times \eta_{VLT} \times \eta_{motor}}$$

η_{motor} is typically at 0.80 (≤ 75 kW/100 hp); 0.85 (11–22 kW/15–30 hp).

η_{VLT} is typically at 0.97.

For FC 360, R_{rec} at 160% braking torque is written as:

$$480V : R_{rec} = \frac{396349}{P_{motor}} [\Omega] \quad 1)$$

$$480V : R_{rec} = \frac{397903}{P_{motor}} [\Omega] \quad 2)$$

1) For frequency converters ≤ 7.5 kW (10 hp) shaft output

2) For frequency converters 11–75 kW (15–100 hp) shaft output

NOTICE

The resistance of the brake resistor should not be higher than the value recommended by Danfoss. If a brake resistor with a higher ohmic value is selected, the 160% braking torque may not be achieved because the frequency converter might cut out for safety reasons. The resistance should be bigger than R_{min} .

NOTICE

If a short circuit in the brake transistor occurs, power dissipation in the brake resistor is only prevented by using a mains switch or contactor to disconnect the mains for the frequency converter. (The contactor can be controlled by the frequency converter).

NOTICE

Do not touch the brake resistor because it can get hot during braking. Place the brake resistor in a secure environment to avoid fire risk.

2.9.4 Control with Brake Function

The brake is protected against short-circuiting of the brake resistor, and the brake transistor is monitored to ensure that short-circuiting of the transistor is detected. A relay/digital output can be used for protecting the brake resistor from overloading caused by a fault in the frequency converter.

In addition, the brake enables readout of the momentary power and the mean power for the latest 120 s. The brake can also monitor the power energizing and make sure that it does not exceed a limit selected in *parameter 2-12 Brake Power Limit (kW)*.

NOTICE

Monitoring the brake power is not a safety function. A thermal switch is required to prevent the brake power from exceeding the limit. The brake resistor circuit is not ground leakage protected.

Overvoltage control (OVC) (exclusive brake resistor) can be selected as an alternative brake function in *parameter 2-17 Over-voltage Control*. This function is active for all units. The function ensures that a trip can be avoided if the DC-link voltage increases. This is done by increasing the output frequency to limit the voltage from the DC link. It is a useful function, for example if the ramp-down time is too short to avoid tripping of the frequency converter. In this situation, the ramp-down time is extended.

NOTICE

OVC can be activated when running a PM motor (when *parameter 1-10 Motor Construction* is set to [1] PM non-salient SPM).

2.10 Smart Logic Controller

Smart logic control (SLC) is a sequence of user-defined actions (see *parameter 13-52 SL Controller Action [x]*) executed by the SLC when the associated user-defined event (see *parameter 13-51 SL Controller Event [x]*) is evaluated as true by the SLC.

The condition for an event can be a particular status or that the output from a logic rule or a comparator operand becomes true. That leads to an associated action as shown in *Illustration 2.36*.

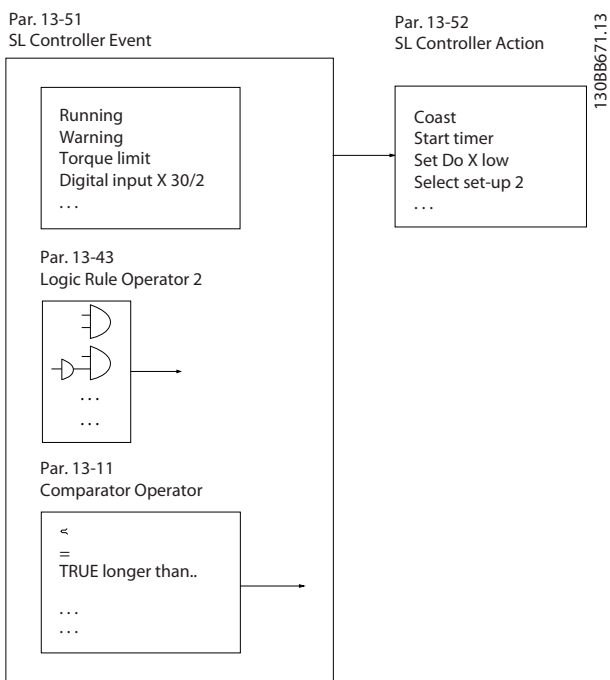

Illustration 2.36 Associated Action

Events and actions are each numbered and linked in pairs (states). This means that when event [0] is fulfilled (attains the value true), action [0] is executed. After this, the conditions of event [1] are evaluated and if evaluated true, action [1] is executed, and so on. Only 1 event is evaluated at any time. If an event is evaluated as false, nothing happens (in the SLC) during the current scan interval, and no other events are evaluated. When the SLC starts, it evaluates event [0] (and only event [0]) each scan interval. Only when event [0] is evaluated true, the SLC executes action [0] and starts evaluating event [1]. It is possible to program 1–20 events and actions.

When the last event/action has been executed, the sequence starts over again from event [0]/action [0].

Illustration 2.37 shows an example with 3 event/actions:

Illustration 2.37 Sequence with 3 Events/Actions

Comparators

Comparators are used for comparing continuous variables (for example output frequency, output current, and analog input) to fixed preset values.

Illustration 2.38 Comparators

Logic rules

Combine up to 3 boolean inputs (true/false inputs) from timers, comparators, digital inputs, status bits, and events using the logical operators and, or, and not.

Illustration 2.39 Logic Rules

2.11 Extreme Running Conditions

Short circuit (motor phase-to-phase)

The frequency converter is protected against short circuits by current measurement in each of the 3 motor phases or in the DC link. A short circuit between 2 output phases causes an overcurrent in the frequency converter. The frequency converter is turned off individually when the short-circuit current exceeds the permitted value (*alarm 16, Trip lock*).

Switching on the output

Switching on the output between the motor and the frequency converter is fully allowed and does not damage the frequency converter. However, fault messages may appear.

Motor-generated overvoltage

The voltage in the DC link is increased when the motor acts as a generator. This occurs in the following cases:

- The load drives the motor (at constant output frequency from the frequency converter).
- If the inertia moment is high during deceleration (ramp-down), the friction is low and the ramp-down time is too short for the energy to be dissipated as a loss in the frequency converter, the motor, and the installation.
- Incorrect slip compensation setting may cause higher DC-link voltage.

The control unit may attempt to correct the ramp if possible (*parameter 2-17 Over-voltage Control*).

The frequency converter turns off to protect the transistors and the DC link capacitors when a certain voltage level is reached.

To select the method used for controlling the DC-link voltage level, see *parameter 2-10 Brake Function* and *parameter 2-17 Over-voltage Control*.

Mains drop-out

During a mains drop-out, the frequency converter keeps running until the DC-link voltage drops below the minimum stop level, which is 320 V. The mains voltage before the drop-out and the motor load determines how long it takes for the inverter to coast.

Static overload in VVC⁺ mode

When the frequency converter is overloaded, the torque limit in *parameter 4-16 Torque Limit Motor Mode/parameter 4-17 Torque Limit Generator Mode* is reached, the control unit reduces the output frequency to reduce the load.

If the overload is excessive, a current may occur that makes the frequency converter cut out after approximately 5–10 s.

Operation within the torque limit is limited in time (0–60 s) in *parameter 14-25 Trip Delay at Torque Limit*.

2.11.1 Motor Thermal Protection

To protect the application from serious damage, the drive offers several dedicated features.

Torque limit

The torque limit protects the motor from being overloaded independent of the speed. Torque limit is controlled in *parameter 4-16 Torque Limit Motor Mode* and *parameter 4-17 Torque Limit Generator Mode*. *Parameter 14-25 Trip Delay at Torque Limit* controls the time before the torque limit warning trips.

Current limit

Parameter 4-18 Current Limit controls the current limit, and *parameter 14-24 Trip Delay at Current Limit* controls the time before the current limit warning trips.

Minimum speed limit

Parameter 4-12 Motor Speed Low Limit [Hz] sets the minimum output speed that the drive can provide.

Maximum speed limit

Parameter 4-14 Motor Speed High Limit [Hz] or *parameter 4-19 Max Output Frequency* sets the maximum output speed that the drive can provide.

ETR (electronic thermal relay)

The drive ETR function measures the actual current, speed, and time to calculate motor temperature. The function also protects the motor from being overheated (warning or trip). An external thermistor input is also available. ETR is an electronic feature that simulates a bimetal relay based on internal measurements. The characteristic is shown in *Illustration 2.40*.

Illustration 2.40 ETR

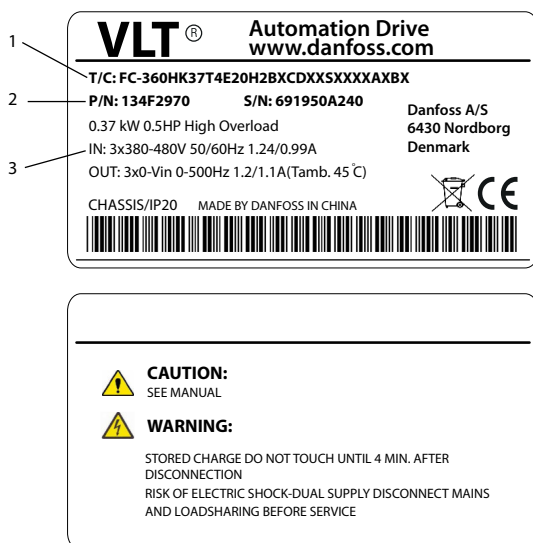

The X-axis shows the ratio between I_{motor} and I_{motor} nominal. The Y-axis shows the time in seconds before the ETR cuts off and trips the drive. The curves show the characteristic nominal speed at twice the nominal speed and at 0.2 x the nominal speed.

At lower speed, the ETR cuts off at lower heat due to less cooling of the motor. In that way, the motor is protected from being overheated even at low speed. The ETR feature calculates the motor temperature based on actual current and speed. The calculated temperature is visible as a readout parameter in *parameter 16-18 Motor Thermal*.

3 Type Code and Selection

3.1 Ordering

Confirm that the equipment matches the requirements and ordering information by checking power size, voltage data, and overload data on the nameplate of the frequency converter.

29-30: Embedded fieldbus	AX: No A0: PROFIBUS AL: PROFINET
31-32: Option B	BX: No option

Table 3.1 Type Code: Selection of Different Features and Options

For options and accessories, refer to the section Options and Accessories in the VLT® AutomationDrive FC 360 Design Guide.

1) Only 11-75 kW (15-100 hp) for normal duty variants. PROFIBUS and PROFINET are unavailable for normal duty.

2) For all power sizes, see chapter 4.1.1 Mains Supply 3x380-480 V AC.

3) H1 RFI filter is available for 0.37-22 kW (0.5-30 hp).

4) 0.37-22 kW (0.5-30 hp) with built-in brake chopper. 30-75 kW (40-100 hp) with external brake chopper only.

Table 3.3 Ordering Numbers for Spare Parts

3.3 Ordering Numbers: Brake Resistors

Danfoss offers a wide variety of different resistors that are specially designed for our frequency converters. See *chapter 2.9.4 Control with Brake Function* for the dimensioning of brake resistors. This section lists the ordering numbers for the brake resistors.

3

Table 4.3 Mains Supply 3x380–480 V AC - Normal Duty¹⁾

1) Heavy duty=150–160% current during 60 s, Normal duty=110% current during 60 s.

2) The typical power loss is at nominal load conditions and expected to be within $\pm 15\%$ (tolerance relates to variety in voltage and cable conditions).

Values are based on a typical motor efficiency (IE2/IE3 border line). Motors with lower efficiency add to the power loss in the frequency converter and motors with high efficiency reduce power loss.

Applies to dimensioning of frequency converter cooling. If the switching frequency is higher than the default setting, the power losses may rise. LCP and typical control card power consumptions are included. Further options and customer load may add up to 30 W to the losses (though typically only 4 W extra for a fully loaded control card, fieldbus, or options for slot B).

For power loss data according to EN 50598-2, refer to www.danfoss.com/vltenergyefficiency.

3) Measured using 5 m shielded motor cables at rated load and rated frequency for enclosure sizes J1–J5, and using 33 m shielded motor cables at rated load and rated frequency for enclosure sizes J6 and J7. For energy efficiency class, see the Ambient Conditions section in chapter 4 Specifications. For part load losses, see www.danfoss.com/vltenergyefficiency.

4.2 General Specifications

Mains supply (L1, L2, L3)

Supply terminals	L1, L2, L3
Supply voltage	380–480 V: -15% (-25%) ¹⁾ to +10%

1) The frequency converter can run at -25% input voltage with reduced performance. The maximum output power of the frequency converter is 75% if input voltage is -25%, and 85% if input voltage is -15%.

Full torque cannot be expected at mains voltage lower than 10% below the lowest rated supply voltage of the frequency converter.

Supply frequency	50/60 Hz ±5%
Maximum imbalance temporary between mains phases	3.0% of rated supply voltage
True power factor (λ)	≥0.9 nominal at rated load
Displacement power factor ($\cos \phi$)	Near unity (>0.98)
Switching on input supply L1, L2, L3 (power-ups) ≤7.5 kW (10 hp)	Maximum 2 times/minute
Switching on input supply L1, L2, L3 (power-ups) 11–75 kW (15–100 hp)	Maximum 1 time/minute

The unit is suitable for use on a circuit capable of delivering less than 5000 RMS symmetrical Amperes, 480 V maximum.

Motor output (U, V, W)

Output voltage	0–100% of supply voltage
Output frequency in U/f mode (for AM motor)	0–500 Hz
Output frequency in VVC ⁺ mode (for AM motor)	0–200 Hz
Output frequency in VVC ⁺ mode (for PM motor)	0–400 Hz
Switching on output	Unlimited
Ramp time	0.01–3600 s

Torque characteristics

Starting torque (high overload)	Maximum 160% for 60 s ¹⁾²⁾
Overload torque (high overload)	Maximum 160% for 60 s ¹⁾²⁾
Starting torque (normal overload)	Maximum 110% for 60 s ¹⁾²⁾
Overload torque (normal overload)	Maximum 110% for 60 s ¹⁾²⁾
Starting current	Maximum 200% for 1 s
Torque rise time in VVC ⁺ (independent of f_{sw})	Maximum 50 ms

1) Percentage relates to the nominal torque. It is 150% for 11–75 kW (15–100 hp) frequency converters.

2) Once every 10 minutes.

Cable lengths and cross-sections¹⁾

Maximum motor cable length, shielded	50 m (164 ft)
Maximum motor cable length, unshielded	0.37–22 kW (0.5–30 hp): 75 m (246 ft), 30–75 kW (40–100 hp): 100 m (328 ft)
Maximum cross-section to control terminals, flexible/rigid wire	2.5 mm ² /14 AWG
Minimum cross-section to control terminals	0.55 mm ² /30 AWG

1) For power cables, see Table 4.1 to Table 4.3.

Digital inputs

Programmable digital inputs	7
Terminal number	18, 19, 27 ¹⁾ , 29 ¹⁾ , 31, 32, 33
Logic	PNP or NPN
Voltage level	0–24 V DC
Voltage level, logic 0 PNP	< 5 V DC
Voltage level, logic 1 PNP	> 10 V DC
Voltage level, logic 0 NPN	> 19 V DC
Voltage level, logic 1 NPN	< 14 V DC
Maximum voltage on input	28 V DC
Pulse frequency range	4 Hz–32 kHz
(Duty cycle) minimum pulse width	4.5 ms

Input resistance, R_i Approximately 4 k Ω

1) Terminals 27 and 29 can also be programmed as output.

Analog inputs

Number of analog inputs 2

Terminal number 53, 54

Modes Voltage or current

Mode select Software

Voltage level 0–10 V

Input resistance, R_i Approximately 10 k Ω

Maximum voltage -15 to +20 V

Current level 0/4 to 20 mA (scaleable)

Input resistance, R_i Approximately 200 Ω

Maximum current 30 mA

Resolution for analog inputs 11 bit

Accuracy of analog inputs Maximum error 0.5% of full scale

Bandwidth 100 Hz

The analog inputs are galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Illustration 4.1 Analog Inputs

NOTICE

HIGH ALTITUDE

For installation at altitudes above 2000 m (6562 ft), contact Danfoss hotline regarding PELV.

Pulse inputs

Programmable pulse inputs 2

Terminal number pulse 29, 33

Maximum frequency at terminal 29, 33 32 kHz (push-pull driven)

Maximum frequency at terminal 29, 33 5 kHz (open collector)

Minimum frequency at terminal 29, 33 4 Hz

Voltage level See the section on digital input

Maximum voltage on input 28 V DC

Input resistance, R_i Approximately 4 k Ω

Pulse input accuracy Maximum error: 0.1% of full scale

Analog outputs

Number of programmable analog outputs 2

Terminal number 45, 42

Current range at analog output 0/4–20 mA

Maximum resistor load to common at analog output 500 Ω

Accuracy on analog output Maximum error: 0.8% of full scale

Resolution on analog output 10 bit

The analog output is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Control card, RS485 serial communication

Terminal number	68 (PTX+, RX+), 69 (N,TX-, RX-)
Terminal number 61	Common for terminals 68 and 69

The RS485 serial communication circuit is galvanically isolated from the supply voltage (PELV).

Digital outputs

Programmable digital/pulse outputs	2
Terminal number	27, 29 ¹⁾
Voltage level at digital/frequency output	0–24 V
Maximum output current (sink or source)	40 mA
Maximum load at frequency output	1 k Ω
Maximum capacitive load at frequency output	10 nF
Minimum output frequency at frequency output	4 Hz
Maximum output frequency at frequency output	32 kHz
Accuracy of frequency output	Maximum error: 0.1% of full scale
Resolution of frequency output	10 bit

1) Terminal 27 and 29 can also be programmed as input.

The digital output is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Control card, 24 V DC output

Terminal number	12
Maximum load	100 mA

The 24 V DC supply is galvanically isolated from the supply voltage (PELV), but has the same potential as the analog and digital inputs and outputs.

Relay outputs

Programmable relay outputs	2
Relay 01 and 02	01–03 (NC), 01–02 (NO), 04–06 (NC), 04–05 (NO)
Maximum terminal load (AC-1) ¹⁾ on 01–02/04–05 (NO) (Resistive load)	250 V AC, 3 A
Maximum terminal load (AC-15) ¹⁾ on 01–02/04–05 (NO) (Inductive load @ cos ϕ 0.4)	250 V AC, 0.2 A
Maximum terminal load (DC-1) ¹⁾ on 01–02/04–05 (NO) (Resistive load)	30 V DC, 2 A
Maximum terminal load (DC-13) ¹⁾ on 01–02/04–05 (NO) (Inductive load)	24 V DC, 0.1 A
Maximum terminal load (AC-1) ¹⁾ on 01–03/04–06 (NC) (Resistive load)	250 V AC, 3 A
Maximum terminal load (AC-15) ¹⁾ on 01–03/04–06 (NC) (Inductive load @ cos ϕ 0.4)	250 V AC, 0.2 A
Maximum terminal load (DC-1) ¹⁾ on 01–03/04–06 (NC) (Resistive load)	30 V DC, 2 A
Minimum terminal load on 01–03 (NC), 01–02 (NO)	24 V DC 10 mA, 24 V AC 20 mA

1) IEC 60947 t 4 and 5.

The relay contacts are galvanically isolated from the rest of the circuit by reinforced isolation.

The relays can be used on different loads (resistive load or inductive load) with different life cycles. The life cycle depends on the configuration of the specific load.

Control card, +10 V DC output

Terminal number	50
Output voltage	10.5 V \pm 0.5 V
Maximum load	15 mA

The 10 V DC supply is galvanically isolated from the supply voltage (PELV) and other high-voltage terminals.

Control characteristics

Resolution of output frequency at 0–500 Hz	\pm 0.003 Hz
System response time (terminals 18, 19, 27, 29, 32, and 33)	\leq 2 ms
Speed control range (open loop)	1:100 of synchronous speed
Speed accuracy (open loop)	\pm 0.5% of nominal speed
Speed accuracy (closed loop)	\pm 0.1% of nominal speed

All control characteristics are based on a 4-pole asynchronous motor.

Ambient conditions

Enclosure sizes J1-J7	IP20
Vibration test, all enclosure sizes	1.0 g
Relative humidity	5-95% (IEC 721-3-3); Class 3K3 (non-condensing) during operation
Aggressive environment (IEC 60068-2-43) H ₂ S test	Class Kd
Test method according to IEC 60068-2-43 H ₂ S (10 days)	
Ambient temperature (at 60 AVM switching mode)	
- with derating	Maximum 55 °C (131 °F) ¹⁾²⁾
- at full continuous output current with some power size	Maximum 50 °C (122 °F)
- at full continuous output current	Maximum 45 °C (113 °F)
Minimum ambient temperature during full-scale operation	0 °C (32 °F)
Minimum ambient temperature at reduced performance	-10 °C (14 °F)
Temperature during storage/transport	-25 to +65/70 °C (-13 to +149/158 °F)
Maximum altitude above sea level without derating	1000 m (3281 ft)
Maximum altitude above sea level with derating	3000 m (9843 ft)
EMC standards, emission	EN 61800-3, EN 61000-3-2, EN 61000-3-3, EN 61000-3-11, EN 61000-3-12, EN 61000-6-3/4, EN 55011, IEC 61800-3 EN 61800-3, EN 61000-6-1/2, EN 61000-4-2,
EMC standards, immunity	EN 61000-4-3, EN 61000-4-4, EN 61000-4-5, EN 61000-4-6
Energy efficiency class ³⁾	IE2

1) Refer to chapter 4.7 Special Conditions for:

- Derating for high ambient temperature.
- Derating for high altitude.

2) To prevent control card overtemperature on PROFIBUS and PROFINET variants of VLT® AutomationDrive FC 360, avoid full digital/analog I/O load at ambient temperature higher than 45 °C (113 °F).

3) Determined according to EN 50598-2 at:

- Rated load.
- 90% rated frequency.
- Switching frequency factory setting.
- Switching pattern factory setting.

Control card performance

Scan interval	1 ms
---------------	------

Protection and features

- Electronic thermal motor protection against overload.
- Temperature monitoring of the heat sink ensures that the frequency converter trips when the temperature reaches a predefined level. An overload temperature cannot be reset until the temperature of the heat sink is below the temperature limit.
- The frequency converter is protected against short circuits on motor terminals U, V, W.
- If a mains phase is missing, the frequency converter trips or issues a warning (depending on the load and parameter setting).
- Monitoring of the intermediate circuit voltage ensures that the frequency converter trips when the intermediate circuit voltage is too low or too high.
- The frequency converter is protected against ground faults on motor terminals U, V, W.

4.3 Fuses

Use fuses and/or circuit breakers on the supply side to protect service personnel and equipment from injuries and damage if there is component breakdown inside the frequency converter (first fault).

Branch circuit protection

Protect all branch circuits in an installation, switchgear, and machines against short circuit and overcurrent according to national/international regulations.

NOTICE

The recommendations do not cover branch circuit protection for UL.

Table 4.4 lists the recommended fuses that have been tested.

! WARNING

PERSONAL INJURY AND EQUIPMENT DAMAGE RISK

Malfunction or failing to follow the recommendations may result in personal risk and damage to the frequency converter and other equipment.

- Select fuses according to recommendations. Possible damage can be limited to be inside the frequency converter.

NOTICE

Using fuses or circuit breakers is mandatory to ensure compliance with IEC 60364 for CE.

Danfoss recommends using the fuses in Table 4.4 on a circuit capable of delivering 100000 A_{rms} (symmetrical), 380–480 V depending on the frequency converter voltage rating. With the proper fusing, the frequency converter short circuit current rating (SCCR) is 100000 A_{rms} .

Enclosure size	Power [kW (hp)]	CE compliance fuse
J1	0.37–1.1 (0.5–1.5)	gG-10
	1.5 (2)	
	2.2 (3)	
J2	3.0 (4)	gG-25
	4.0 (5.5)	
	5.5 (7.5)	
J3	7.5 (10)	gG-32
J4	11–15 (15–20)	gG-50

J7	55 (75)	aR-250
	75 (100)	

Table 4.4 CE Fuse, 380–480 V, Enclosure Sizes J1–J7

4.4 Efficiency

Efficiency of the frequency converter (η_{VLT})

The load on the frequency converter has little effect on its efficiency. In general, the efficiency is the same at the rated motor frequency $f_{M,N}$, even if the motor supplies 100% of the rated shaft torque or only 75%, i.e. in case of part loads.

This also means that the efficiency of the frequency converter does not change even if other U/f characteristics are selected.

However, the U/f characteristics influence the efficiency of the motor.

The efficiency declines a little when the switching frequency is set to a value above the default value. The efficiency is also slightly reduced if the mains voltage is 480 V, or if the motor cable is longer than 30 m.

Frequency converter efficiency calculation

Calculate the efficiency of the frequency converter at different loads based on *Illustration 4.2*. The factor in this graph must be multiplied with the specific efficiency factor listed in the specification tables:

Illustration 4.2 Typical Efficiency Curves

Efficiency of the motor (η_{MOTOR})

The efficiency of a motor connected to the frequency converter depends on the magnetizing level. In general, the efficiency is just as good as with mains operation. The efficiency of the motor depends on the type of motor.

In the range of 75–100% of the rated torque, the efficiency of the motor is practically constant, both when it is controlled by the frequency converter and when it runs directly on mains.

In small motors, the influence from the U/f characteristic on efficiency is marginal. However, in motors from 11 kW (15 hp) and up, the advantages are significant.

In general, the switching frequency does not affect the efficiency of small motors. Motors from 11 kW (15 hp) and up achieve efficiency improvements of 1–2% because the sine shape of the motor current is almost perfect at high switching frequency.

Efficiency of the system (η_{SYSTEM})

To calculate the system efficiency, the efficiency of the frequency converter (η_{VLT}) is multiplied by the efficiency of the motor (η_{MOTOR}):

$$\eta_{SYSTEM} = \eta_{VLT} \times \eta_{MOTOR}$$

4.5 Acoustic Noise

The acoustic noise from the frequency converter comes from 3 sources:

- DC intermediate circuit coils.
- Integral fan.
- RFI filter choke.

The typical values measured at a distance of 1 m (3.3 ft) from the unit are:

Enclosure size	50% fan speed [dBA]	Full fan speed [dBA]
J1 (0.37–2.2 kW/0.5–3.0 hp)	N.A. ¹⁾	51
J2 (3.0–5.5 kW/4.0–7.5 hp)	N.A. ¹⁾	55
J3 (7.5 kW/10 hp)	N.A. ¹⁾	54
J4 (11–15 kW/15–20 hp)	52	66
J5 (18.5–22 kW/25–30 hp)	57.5	63
J6 (30–45 kW/40–60 hp)	56	71
J7 (55–75 kW/75–100 hp)	63	72

Table 4.5 Typical Measured Values

1) For J1–J3, the fan speed is fixed.

4.6 dU/dt Conditions

When a transistor in the frequency converter bridge switches, the voltage across the motor increases by a dU/dt ratio depending on the following factors:

- The motor cable type.
- The cross-section of the motor cable.
- The length of the motor cable.
- Whether the motor cable is shielded or not.
- Inductance.

The natural induction causes an overshoot U_{PEAK} in the motor voltage before it stabilizes itself at a level depending on the voltage in the intermediate circuit. The rise time and the peak voltage U_{PEAK} affect the service life of the motor. If the peak voltage is too high, motors without phase coil insulation are affected. The longer the motor cable, the higher the rise time and peak voltage.

Peak voltage on the motor terminals is caused by the switching of the IGBTs. The FC 360 complies with IEC 60034-25 regarding motors designed to be controlled by frequency converters. The FC 360 also complies with IEC 60034-17 regarding Norm motors controlled by frequency converters.

The following dU/dt data are measured at the motor terminal side:

Cable length [m (ft)]	Mains voltage [V]	Rise time [μsec]	U _{PEAK} [kV]	dU/dt [kV/μsec]
5 (16.4)	400	0.164	0.98	5.4

4.7 Special Conditions

Under some special conditions, where the operation of the frequency converter is challenged, consider derating. In some conditions, derating must be done manually. In other conditions, the frequency converter automatically performs a degree of derating when necessary. Derating is done to ensure the performance at critical stages where the alternative could be a trip.

4.7.1 Manual Derating

Manual derating must be considered for:

- Air pressure – for installation at altitudes above 1000 m (3281 ft).
- Motor speed – at continuous operation at low RPM in constant torque applications.
- Ambient temperature – above 45 °C (113 °F), for some types above 50 °C (122 °F), for details, see *Illustration 4.3 to Illustration 4.9, Table 4.15 and Table 4.16.*

Table 4.16 Derating at 480 V

4.7.2 Automatic Derating

The frequency converter constantly checks for critical levels:

- Critical high temperature on the control card or heat sink.
- High motor load.
- Low motor speed.
- Protection signals (overvoltage/undervoltage, overcurrent, ground fault, and short circuit) are triggered.

As a response to a critical level, the frequency converter adjusts the switching frequency.

4.8 Enclosure Sizes, Power Ratings, and Dimensions

	Enclosure size	J1	J2	J3	J4	J5	J6	J7
Power size [kW (hp)]	3-phase 380–480 V	0.37–2.2 (0.5–3.0)	3.0–5.5 (4.0–7.5)	7.5 (10)	11–15 (15–20)	18.5–22 (25–30)	30–45 (40–60)	55–75 (75–100)

5 RS485 Installation and Set-up

5.1 Introduction

5.1.1 Overview

RS485 is a 2-wire bus interface compatible with multi-drop network topology. The nodes can be connected as a bus, or via drop cables from a common trunk line. A total of 32 nodes can be connected to 1 network segment. Repeaters divide network segments, see *Illustration 5.1*.

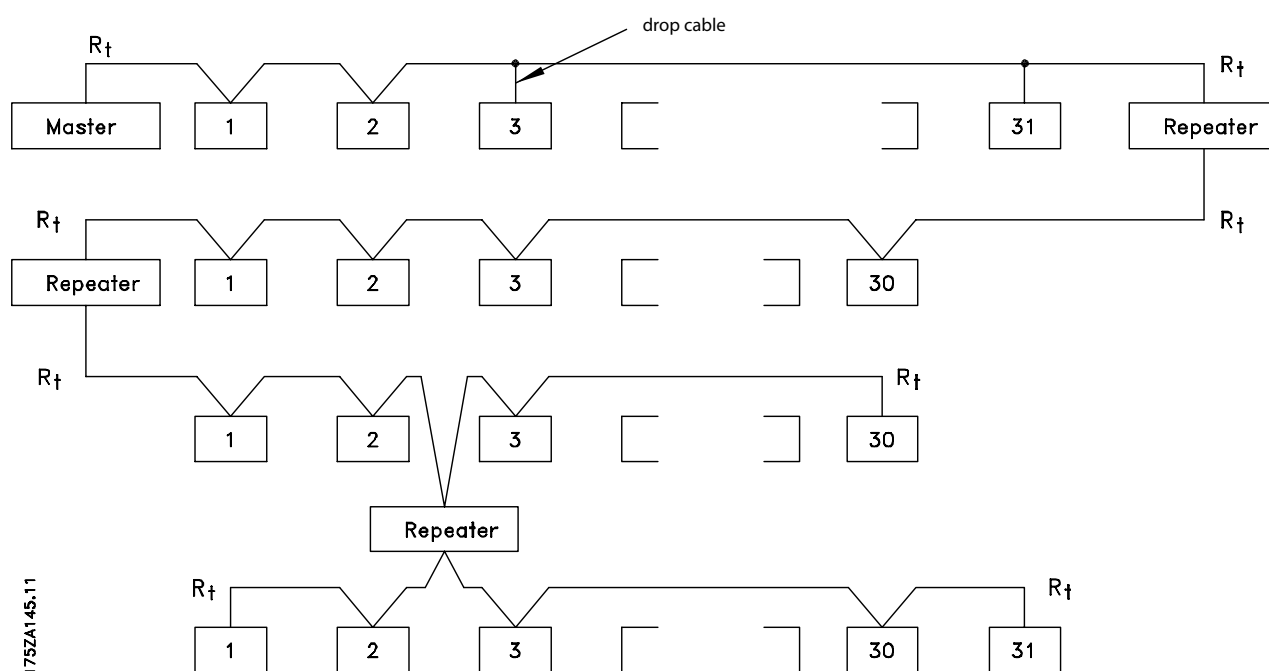

Illustration 5.1 RS485 Bus Interface

NOTICE

Each repeater functions as a node within the segment in which it is installed. Each node connected within a given network must have a unique node address across all segments.

Terminate each segment at both ends, using either the termination switch (S801) of the frequency converters or a biased termination resistor network. Always use shielded twisted pair (STP) cable for bus cabling and follow good common installation practice.

Low-impedance ground connection of the shield at every node is important, including at high frequencies. Thus, connect a large surface of the shield to ground, for example with a cable clamp or a conductive cable gland. Sometimes, it is necessary to apply potential-equalizing cables to maintain the same ground potential throughout the network, particularly in installations with long cables.

To prevent impedance mismatch, use the same type of cable throughout the entire network. When connecting a motor to the frequency converter, always use shielded motor cable.

Cable	Shielded twisted pair (STP)
Impedance [Ω]	120
Cable length [m (ft)]	Maximum 1200 (3937) (including drop lines). Maximum 500 (1640) station-to-station.

Table 5.1 Cable Specifications

5.1.2 Network Connection

Connect the frequency converter to the RS485 network as follows (see also *Illustration 5.2*):

1. Connect signal wires to terminal 68 (P+) and terminal 69 (N-) on the main control board of the frequency converter.
2. Connect the cable shield to the cable clamps.

NOTICE

To reduce noise between conductors, use shielded, twisted-pair cables.

Illustration 5.2 Network Connection

5.1.3 Hardware Set-up

To terminate the RS485 bus, use the terminator switch on the main control board of the frequency converter.

The factory setting for the switch is OFF.

5.1.4 Parameter Settings for Modbus Communication

Parameter	Function
Parameter 8-30 Protocol	Select the application protocol to run for the RS485 interface.
Parameter 8-31 Address	Set the node address. NOTICE The address range depends on the protocol selected in <i>parameter 8-30 Protocol</i> .
Parameter 8-32 Baud Rate	Set the baud rate. NOTICE The default baud rate depends on the protocol selected in <i>parameter 8-30 Protocol</i> .
Parameter 8-33 Parity / Stop Bits	Set the parity and number of stop bits. NOTICE The default selection depends on the protocol selected in <i>parameter 8-30 Protocol</i> .
Parameter 8-35 Minimum Response Delay	Specify a minimum delay time between receiving a request and transmitting a response. This function is for overcoming modem turnaround delays.
Parameter 8-36 Maximum Response Delay	Specify a maximum delay time between transmitting a request and receiving a response.
Parameter 8-37 Maximum Inter-character delay	If transmission is interrupted, specify a maximum delay time between 2 received bytes to ensure timeout. NOTICE The default selection depends on the protocol selected in <i>parameter 8-30 Protocol</i> .

Table 5.2 Modbus Communication Parameter Settings

5.1.5 EMC Precautions

To achieve interference-free operation of the RS485 network, Danfoss recommends the following EMC precautions.

NOTICE

Observe relevant national and local regulations, for example regarding protective earth connection. To avoid coupling of high-frequency noise between the cables, keep the RS485 communication cable away from motor and brake resistor cables. Normally, a distance of 200 mm (8 in) is sufficient. Maintain the greatest possible distance between the cables, especially where cables run in parallel over long distances. When crossing is unavoidable, the RS485 cable must cross motor and brake resistor cables at an angle of 90°.

5.2 FC Protocol

5.2.1 Overview

The FC protocol, also referred to as FC bus or standard bus, is the Danfoss standard fieldbus. It defines an access technique according to the master/slave principle for communications via a fieldbus.

One master and a maximum of 126 slaves can be connected to the bus. The master selects the individual slaves via an address character in the telegram. A slave itself can never transmit without first being requested to do so, and direct telegram transfer between the individual slaves is not possible. Communications occur in the half-duplex mode.

The master function cannot be transferred to another node (single-master system).

The physical layer is RS485, thus utilizing the RS485 port built into the frequency converter. The FC protocol supports different telegram formats:

- A short format of 8 bytes for process data.
- A long format of 16 bytes that also includes a parameter channel.
- A format used for texts.

5.2.2 FC with Modbus RTU

The FC protocol provides access to the control word and bus reference of the frequency converter.

The control word allows the Modbus master to control several important functions of the frequency converter:

- Start.
- Stop of the frequency converter in various ways:
 - Coast stop.
 - Quick stop.
 - DC brake stop.
 - Normal (ramp) stop.
- Reset after a fault trip.
- Run at various preset speeds.
- Run in reverse.
- Change of the active set-up.
- Control of the 2 relays built into the frequency converter.

The bus reference is commonly used for speed control. It is also possible to access the parameters, read their values, and where possible, write values to them. Accessing the parameters offers a range of control options, including controlling the setpoint of the frequency converter when its internal PI controller is used.

5.3 Network Configuration

To enable the FC protocol for the frequency converter, set the following parameters.

Parameter	Setting
Parameter 8-30 Protocol	FC
Parameter 8-31 Address	1–126
Parameter 8-32 Baud Rate	2400–115200
Parameter 8-33 Parity / Stop Bits	Even parity, 1 stop bit (default)

Table 5.3 Parameters to Enable the Protocol

5.4 FC Protocol Message Framing Structure

5.4.1 Content of a Character (byte)

Each character transferred begins with a start bit. Then 8 data bits are transferred, corresponding to a byte. Each character is secured via a parity bit. This bit is set at 1 when it reaches parity. Parity is when there is an equal number of 1s in the 8 data bits and the parity bit in total. A stop bit completes a character, consisting of 11 bits in all.

Illustration 5.3 Content of a Character

5.4.2 Telegram Structure

Each telegram has the following structure:

- Start character (STX) = 02 hex.
- A byte denoting the telegram length (LGE).
- A byte denoting the frequency converter address (ADR).

Several data bytes (variable, depending on the type of telegram) follow.

A data control byte (BCC) completes the telegram.

Illustration 5.4 Telegram Structure

5.4.3 Telegram Length (LGE)

The telegram length is the number of data bytes plus the address byte ADR and the data control byte BCC.

4 data bytes	$LGE=4+1+1=6$ bytes
12 data bytes	$LGE=12+1+1=14$ bytes
Telegrams containing texts	$10^{1)}+n$ bytes

Table 5.4 Length of Telegrams

1) 10 represents the fixed characters, while n is variable (depending on the length of the text).

5.4.4 Frequency Converter Address (ADR)

Address format 1-126

- Bit 7 = 1 (address format 1-126 active).
- Bit 0-6 = frequency converter address 1-126.
- Bit 0-6 = 0 broadcast.

The slave returns the address byte unchanged to the master in the response telegram.

5.4.5 Data Control Byte (BCC)

The checksum is calculated as an XOR-function. Before the first byte in the telegram is received, the calculated checksum is 0.

5.4.6 The Data Field

The structure of data blocks depends on the type of telegram. There are 3 telegram types, and the type applies for both control telegrams (master⇒slave) and response telegrams (slave⇒master).

The 3 types of telegram are:

Process block (PCD)

The PCD is made up of a data block of 4 bytes (2 words) and contains:

- Control word and reference value (from master to slave).
- Status word and present output frequency (from slave to master).

Illustration 5.5 Process Block

Parameter block

The parameter block is used to transfer parameters between master and slave. The data block is made up of 12 bytes (6 words) and also contains the process block.

Illustration 5.6 Parameter Block

Text block

The text block is used to read or write texts via the data block.

Illustration 5.7 Text Block

5.4.7 The PKE Field

The PKE field contains 2 subfields:

- Parameter command and response (AK).
- Parameter number (PNU).

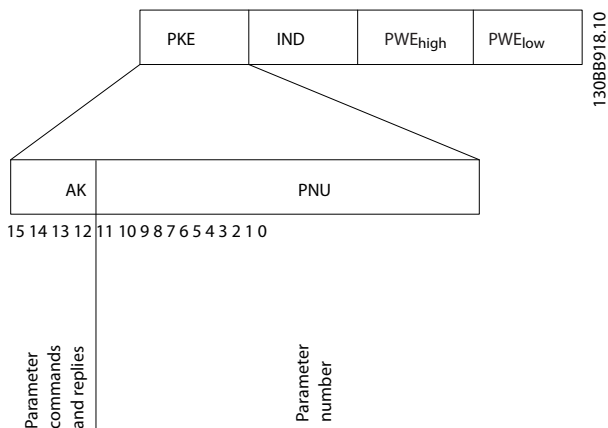

Illustration 5.8 PKE Field

Bits 12–15 transfer parameter commands from master to slave and return processed slave responses to the master.

Parameter commands master⇒slave				
Bit number				Parameter command
15	14	13	12	
0	0	0	0	No command.
0	0	0	1	Read parameter value.
0	0	1	0	Write parameter value in RAM (word).
0	0	1	1	Write parameter value in RAM (double word).
1	1	0	1	Write parameter value in RAM and EEPROM (double word).
1	1	1	0	Write parameter value in RAM and EEPROM (word).
1	1	1	1	Read text.

Table 5.5 Parameter Commands

Response slave⇒master				
Bit number				Response
15	14	13	12	
0	0	0	0	No response.
0	0	0	1	Parameter value transferred (word).
0	0	1	0	Parameter value transferred (double word).
0	1	1	1	Command cannot be performed.
1	1	1	1	Text transferred.

Table 5.6 Response

If the command cannot be performed, the slave sends *0111 Command cannot be performed* response and issues the following fault reports in Table 5.7.

Fault code	FC specification
0	Illegal parameter number.
1	Parameter cannot be changed.
2	Upper or lower limit is exceeded.
3	Subindex is corrupted.
4	No array.
5	Wrong data type.
6	Not used.
7	Not used.
9	Description element is not available.
11	No parameter write access.
15	No text available.
17	Not applicable while running.
18	Other errors.
100	–
>100	–
130	No bus access for this parameter.
131	Write to factory set-up is not possible.
132	No LCP access.
252	Unknown viewer.
253	Request is not supported.
254	Unknown attribute.
255	No error.

Table 5.7 Slave Report

5.4.8 Parameter Number (PNU)

Bits 0–11 transfer parameter numbers. The function of the relevant parameter is defined in the parameter description in the *VLT® AutomationDrive FC 360 Programming Guide*.

5.4.9 Index (IND)

The index is used with the parameter number to read/write access parameters with an index, for example, *parameter 15-30 Alarm Log: Error Code*. The index consists of 2 bytes: a low byte and a high byte.

Only the low byte is used as an index.

5.4.10 Parameter Value (PWE)

The parameter value block consists of 2 words (4 bytes), and the value depends on the defined command (AK). The master prompts for a parameter value when the PWE block contains no value. To change a parameter value (write), write the new value in the PWE block and send from the master to the slave.

When a slave responds to a parameter request (read command), the present parameter value in the PWE block is transferred and returned to the master. If a parameter contains several data options, for example

parameter 0-01 Language, select the data value by entering the value in the PWE block. Serial communication is only capable of reading parameters containing data type 9 (text string).

Parameter 15-40 FC Type to parameter 15-53 Power Card Serial Number contain data type 9.

For example, read the unit size and mains voltage range in *parameter 15-40 FC Type*. When a text string is transferred (read), the length of the telegram is variable, and the texts are of different lengths. The telegram length is defined in the 2nd byte of the telegram (LGE). When using text transfer, the index character indicates whether it is a read or a write command.

To read a text via the PWE block, set the parameter command (AK) to F hex. The index character high-byte must be 4.

5.4.11 Data Types Supported by the Frequency Converter

Unsigned means that there is no operational sign in the telegram.

Data types	Description
3	Integer 16
4	Integer 32
5	Unsigned 8
6	Unsigned 16
7	Unsigned 32
9	Text string

Table 5.8 Data Types

5.4.12 Conversion

The *programming guide* contains the descriptions of attributes of each parameter. Parameter values are transferred as whole numbers only. Conversion factors are used to transfer decimals.

Parameter 4-12 Motor Speed Low Limit [Hz] has a conversion factor of 0.1. To preset the minimum frequency to 10 Hz, transfer the value 100. A conversion factor of 0.1 means that the value transferred is multiplied by 0.1. The value 100 is thus perceived as 10.0.

Conversion index	Conversion factor
74	3600
2	100
1	10
0	1
-1	0.1
-2	0.01
-3	0.001
-4	0.0001
-5	0.00001

Table 5.9 Conversion

5.4.13 Process Words (PCD)

The block of process words is divided into 2 blocks of 16 bits, which always occur in the defined sequence.

PCD 1	PCD 2
Control telegram (master→slave control word)	Reference value
Control telegram (slave→master) status word	Present output frequency

Table 5.10 Process Words (PCD)

5.5 Examples

5.5.1 Writing a Parameter Value

Change *parameter 4-14 Motor Speed High Limit [Hz]* to 100 Hz.

Write the data in EEPROM.

PKE = E19E hex - Write single word in *parameter 4-14 Motor Speed High Limit [Hz]*:

- IND = 0000 hex.
- PWEHIGH = 0000 hex.
- PWELow = 03E8 hex.

Data value 1000, corresponding to 100 Hz, see *chapter 5.4.12 Conversion*.

The telegram looks like *Illustration 5.9*.

E19E	H	0000	H	0000	H	03E8	H
PKE		IND		PWE _{high}		PWE _{low}	

Illustration 5.9 Telegram

130BA092.10

NOTICE

Parameter 4-14 Motor Speed High Limit [Hz] is a single word, and the parameter command for write in EEPROM is **E. Parameter 4-14 Motor Speed High Limit [Hz]** is 19E in hexadecimal.

The response from the slave to the master is shown in *Illustration 5.10*.

119E	H	0000	H	0000	H	03E8	H
PKE		IND		PWE _{high}		PWE _{low}	

130BA093.10

Illustration 5.10 Response from Master

5.5.2 Reading a Parameter Value

Read the value in *parameter 3-41 Ramp 1 Ramp Up Time*.

PKE = 1155 hex - Read parameter value in *parameter 3-41 Ramp 1 Ramp Up Time*:

- IND = 0000 hex.
- PWE_{HIGH} = 0000 hex.
- PWE_{LOW} = 0000 hex.

1155	H	0000	H	0000	H	0000	H
PKE		IND		PWE _{high}		PWE _{low}	

130BA094.10

Illustration 5.11 Telegram

If the value in *parameter 3-41 Ramp 1 Ramp Up Time* is 10 s, the response from the slave to the master is shown in *Illustration 5.12*.

1155	H	0000	H	0000	H	03E8	H
PKE		IND		PWE _{high}		PWE _{low}	

130BA267.10

Illustration 5.12 Response

3E8 hex corresponds to 1000 decimal. The conversion index for *parameter 3-41 Ramp 1 Ramp Up Time* is -2, that is, 0.01.

Parameter 3-41 Ramp 1 Ramp Up Time is of the type *Unsigned 32*.

5.6 Modbus RTU

5.6.1 Prerequisite Knowledge

Danfoss assumes that the installed controller supports the interfaces in this manual and strictly observes all requirements and limitations stipulated in the controller and frequency converter.

The built-in Modbus RTU (remote terminal unit) is designed to communicate with any controller that supports the interfaces defined in this manual. It is assumed that the user has full knowledge of the capabilities and limitations of the controller.

5.6.2 Overview

Regardless of the type of physical communication networks, this section describes the process that a controller uses to request access to another device. This process includes how the Modbus RTU responds to requests from another device, and how errors are detected and reported. It also establishes a common format for the layout and contents of telegram fields.

During communications over a Modbus RTU network, the protocol:

- Determines how each controller learns its device address.
- Recognizes a telegram addressed to it.
- Determines which actions to take.
- Extracts any data or other information contained in the telegram.

If a reply is required, the controller constructs the reply telegram and sends it.

Controllers communicate using a master/slave technique in which only the master can initiate transactions (called queries). Slaves respond by supplying the requested data to the master, or by acting as requested in the query. The master can address individual slaves, or initiate a broadcast telegram to all slaves. Slaves return a response to queries that are addressed to them individually. No responses are returned to broadcast queries from the master.

The Modbus RTU protocol establishes the format for the master query by providing the following information:

- The device (or broadcast) address.
- A function code defining the requested action.
- Any data to be sent.
- An error-checking field.

The response telegram of the slave device is also constructed using Modbus protocol. It contains fields confirming the action taken, any data to be returned, and

an error-checking field. If an error occurs in receipt of the telegram, or if the slave is unable to perform the requested action, the slave constructs and sends an error message. Alternatively, a timeout occurs.

5.6.3 Frequency Converter with Modbus RTU

The frequency converter communicates in Modbus RTU format over the built-in RS485 interface. Modbus RTU provides access to the control word and bus reference of the frequency converter.

The control word allows the Modbus master to control several important functions of the frequency converter:

- Start.
- Various stops:
 - Coast stop.
 - Quick stop.
 - DC brake stop.
 - Normal (ramp) stop.
- Reset after a fault trip.
- Run at various preset speeds.
- Run in reverse.
- Change the active set-up.
- Control built-in relay of the frequency converter.

The bus reference is commonly used for speed control. It is also possible to access the parameters, read their values, and, where possible, write values to them. Accessing the parameters offers a range of control options, including controlling the setpoint of the frequency converter when its internal PI controller is used.

5.7 Network Configuration

To enable Modbus RTU on the frequency converter, set the following parameters:

Parameter	Setting
Parameter 8-30 Protocol	Modbus RTU
Parameter 8-31 Address	1–247
Parameter 8-32 Baud Rate	2400–115200
Parameter 8-33 Parity / Stop Bits	Even parity, 1 stop bit (default)

Table 5.11 Network Configuration

5.8 Modbus RTU Message Framing Structure

5.8.1 Introduction

The controllers are set up to communicate on the Modbus network using RTU (remote terminal unit) mode, with each byte in a telegram containing 2 4-bit hexadecimal characters. The format for each byte is shown in Table 5.12.

Start bit	Data byte								Stop/parity	Stop

Table 5.12 Format for Each Byte

Coding system	8-bit binary, hexadecimal 0–9, A–F. 2 hexadecimal characters contained in each 8-bit field of the telegram.
Bits per byte	<ul style="list-style-type: none"> • 1 start bit. • 8 data bits, least significant bit sent first. • 1 bit for even/odd parity; no bit for no parity. • 1 stop bit if parity is used; 2 bits if no parity.
Error check field	Cyclic redundancy check (CRC).

Table 5.13 Byte Details

5.8.2 Modbus RTU Telegram Structure

The transmitting device places a Modbus RTU telegram into a frame with a known beginning and ending point. This allows receiving devices to begin at the start of the telegram, read the address portion, determine which device is addressed (or all devices, if the telegram is broadcast), and to recognize when the telegram is completed. Partial telegrams are detected and errors set as a result. Characters for transmission must be in hexadecimal 00–FF format in each field. The frequency converter continuously monitors the network bus, also during silent intervals. When the first field (the address field) is received, each frequency converter or device decodes it to determine which device is being addressed. Modbus RTU telegrams addressed to 0 are broadcast telegrams. No response is permitted for broadcast telegrams. A typical telegram frame is shown in Table 5.14.

Start	Address	Function	Data	CRC check	End
T1-T2-T3-T4	8 bits	8 bits	N x 8 bits	16 bits	T1-T2-T3-T4

Table 5.14 Typical Modbus RTU Telegram Structure

5.8.3 Start/Stop Field

Telegrams start with a silent period of at least 3.5 character intervals. The silent period is implemented as a multiple of character intervals at the selected network baud rate (shown as Start T1-T2-T3-T4). The first field to be transmitted is the device address. Following the last transmitted character, a similar period of at least 3.5 character intervals marks the end of the telegram. A new telegram can begin after this period.

Transmit the entire telegram frame as a continuous stream. If a silent period of more than 1.5 character intervals occurs before completion of the frame, the receiving device flushes the incomplete telegram and assumes that the next byte is the address field of a new telegram. Similarly, if a new telegram begins before 3.5 character intervals after a previous telegram, the receiving device considers it a continuation of the previous telegram. This behavior causes a timeout (no response from the slave), since the value in the final CRC field is not valid for the combined telegrams.

5.8.4 Address Field

The address field of a telegram frame contains 8 bits. Valid slave device addresses are in the range of 0–247 decimal. The individual slave devices are assigned addresses in the range of 1–247. 0 is reserved for broadcast mode, which all slaves recognize. A master addresses a slave by placing the slave address in the address field of the telegram. When the slave sends its response, it places its own address in this address field to let the master know which slave is responding.

5.8.5 Function Field

The function field of a telegram frame contains 8 bits. Valid codes are in the range of 1–FF. Function fields are used to send telegrams between master and slave. When a telegram is sent from a master to a slave device, the function code field tells the slave what kind of action to perform. When the slave responds to the master, it uses the function code field to indicate either a normal (error-free) response, or that some kind of error occurred (called an exception response).

For a normal response, the slave simply echoes the original function code. For an exception response, the slave returns a code that is equivalent to the original function code with its most significant bit set to logic 1. In addition, the slave places a unique code into the data field of the response telegram. This code tells the master what kind of error occurred, or the reason for the exception. Also refer to *chapter 5.8.10 Function Codes Supported by Modbus RTU* and *chapter 5.8.11 Modbus Exception Codes*.

5.8.6 Data Field

The data field is constructed using sets of 2 hexadecimal digits, in the range of 00–FF hexadecimal. These digits are made up of 1 RTU character. The data field of telegrams sent from a master to a slave device contains additional information which the slave must use to perform accordingly.

The information can include items such as:

- Coil or register addresses.
- The quantity of items to be handled.
- The count of actual data bytes in the field.

5.8.7 CRC Check Field

Telegrams include an error-checking field, operating based on a cyclic redundancy check (CRC) method. The CRC field checks the contents of the entire telegram. It is applied regardless of any parity check method used for the individual characters of the telegram. The transmitting device calculates the CRC value and appends the CRC as the last field in the telegram. The receiving device recalculates a CRC during receipt of the telegram and compares the calculated value to the actual value received in the CRC field. 2 unequal values result in bus timeout. The error-checking field contains a 16-bit binary value implemented as 2 8-bit bytes. After the implementation, the low-order byte of the field is appended first, followed by the high-order byte. The CRC high-order byte is the last byte sent in the telegram.

5.8.8 Coil Register Addressing

In Modbus, all data is organized in coils and holding registers. Coils hold a single bit, whereas holding registers hold a 2 byte word (that is 16 bits). All data addresses in Modbus telegrams are referenced to 0. The first occurrence of a data item is addressed as item number 0. For example: The coil known as coil 1 in a programmable controller is addressed as coil 0000 in the data address field of a Modbus telegram. Coil 127 decimal is addressed as coil 007Ehex (126 decimal). Holding register 40001 is addressed as register 0000 in the data address field of the telegram. The function code field already specifies a holding register operation. Therefore, the 4XXXX reference is implicit. Holding register 40108 is addressed as register 006Bhex (107 decimal).

Coil number	Description	Signal direction
1–16	Frequency converter control word (see Table 5.16).	Master to slave
17–32	Frequency converter speed or setpoint reference range 0x0–0xFFFF (-200% ... ~200%).	Master to slave
33–48	Frequency converter status word (see Table 5.17).	Slave to master
49–64	Open-loop mode: Frequency converter output frequency. Closed-loop mode: Frequency converter feedback signal.	Slave to master
65	Parameter write control (master to slave).	Master to slave
	0 = Parameter changes are written to the RAM of the frequency converter.	
	1 = Parameter changes are written to the RAM and EEPROM of the frequency converter.	
66–65536	Reserved.	–

Table 5.15 Coil Register

Coil	0	1
01	Preset reference lsb	
02	Preset reference msb	
03	DC brake	No DC brake
04	Coast stop	No coast stop
05	Quick stop	No quick stop
06	Freeze frequency	No freeze frequency
07	Ramp stop	Start
08	No reset	Reset
09	No jog	Jog
10	Ramp 1	Ramp 2
11	Data not valid	Data valid
12	Relay 1 off	Relay 1 on

46	No voltage warning	Voltage warning
47	Not in current limit	Current limit
48	No thermal warning	Thermal warning

Table 5.17 Frequency Converter Status Word (FC Profile)

Bus address	Bus register ¹⁾	PLC register	Content	Access	Description
0	1	40001	Reserved	–	Reserved for legacy frequency converters VLT® 5000 and VLT® 2800.
1	2	40002	Reserved	–	Reserved for legacy frequency converters VLT® 5000 and VLT® 2800.
2	3	40003	Reserved	–	Reserved for legacy frequency converters VLT® 5000 and VLT® 2800.
3	4	40004	Free	–	–
4	5	40005	Free	–	–
5	6	40006	Modbus configuration	Read/Write	TCP only. Reserved for Modbus TCP (<i>parameter 12-28 Store Data Values</i> and <i>parameter 12-29 Store Always</i> - stored in, for example, EEPROM).
6	7	40007	Last fault code	Read only	Fault code received from parameter database, refer to WHAT 38295 for details.
7	8	40008	Last error register	Read only	Address of register with which last error occurred, refer to WHAT 38296 for details.
8	9	40009	Index pointer	Read/Write	Subindex of parameter to be accessed. Refer to WHAT 38297 for details.
9	10	40010	<i>Parameter 0-01 Language</i>	Dependent on parameter access	<i>Parameter 0-01 Language</i> (Modbus register = 10 parameter number) 20 bytes space reserved for parameter in Modbus map.
19	20	40020	<i>Parameter 0-02 Motor Speed Unit</i>	Dependent on parameter access	<i>Parameter 0-02 Motor Speed Unit</i> 20 bytes space reserved for parameter in Modbus map.
29	30	40030	<i>Parameter 0-03 Regional Settings</i>	Dependent on parameter access	<i>Parameter 0-03 Regional Settings</i> 20 bytes space reserved for parameter in Modbus map.

Table 5.18 Address/Registers

1) Value written in the Modbus RTU telegram must be 1 or less than the register number. For example, Read Modbus Register 1 by writing value 0 in the telegram.

5.8.9 How to Control the Frequency Converter

This section describes codes which can be used in the function and data fields of a Modbus RTU telegram.

5.8.10 Function Codes Supported by Modbus RTU

Modbus RTU supports use of the following function codes in the function field of a telegram:

Function	Function code (hex)
Read coils	1
Read holding registers	3
Write single coil	5
Write single register	6
Write multiple coils	F
Write multiple registers	10
Get comm. event counter	B
Report slave ID	11

Table 5.19 Function Codes

Function	Function code	Subfunction code	Subfunction
Diagnostics	8	1	Restart communication.
		2	Return diagnostic register.
		10	Clear counters and diagnostic register.
		11	Return bus message count.
		12	Return bus communication error count.
		13	Return slave error count.
		14	Return slave message count.

Table 5.20 Function Codes

5.8.11 Modbus Exception Codes

For a full explanation of the structure of an exception code response, refer to *chapter 5.8.5 Function Field*.

Code	Name	Meaning
1	Illegal function	The function code received in the query is not an allowable action for the server (or slave). This may be because the function code is only applicable to newer devices and was not implemented in the unit selected. It could also indicate that the server (or slave) is in the wrong state to process a request of this type, for example because it is not configured and is being asked to return register values.
2	Illegal data address	The data address received in the query is not an allowable address for the server (or slave). More specifically, the combination of reference number and transfer length is invalid. For a controller with 100 registers, a request with offset 96 and length 4 succeeds, while a request with offset 96 and length 5 generates exception 02.
3	Illegal data value	A value contained in the query data field is not an allowable value for server (or slave). This indicates a fault in the structure of the remainder of a complex request, such as that the implied length is incorrect. It does NOT mean that a data item submitted for storage in a register has a value outside the expectation of the application program, since the Modbus protocol is unaware of the significance of any value of any register.
4	Slave device failure	An unrecoverable error occurred while the server (or slave) was attempting to perform the requested action.

Table 5.21 Modbus Exception Codes

5.9 How to Access Parameters

5.9.1 Parameter Handling

The PNU (parameter number) is translated from the register address contained in the Modbus read or write message. The parameter number is translated to Modbus as (10 x parameter number) decimal. Example: Reading *parameter 3-12 Catch up/slow Down Value* (16 bit): The holding register 3120 holds the parameters' values. A value of 1352 (decimal) means that the parameter is set to 12.52%.

Reading *parameter 3-14 Preset Relative Reference* (32 bit): The holding registers 3410 and 3411 hold the parameters' values. A value of 11300 (decimal) means that the parameter is set to 1113.00.

For information on the parameters, size, and conversion index, see the programming guide.

5.9.2 Storage of Data

The coil 65 decimal determines whether data written to the frequency converter is stored in EEPROM and RAM (coil 65 = 1), or only in RAM (coil 65 = 0).

5.9.3 IND (Index)

Some parameters in the frequency converter are array parameters, for example *parameter 3-10 Preset Reference*. Since the Modbus does not support arrays in the holding registers, the frequency converter has reserved the holding register 9 as pointer to the array. Before reading or writing an array parameter, set the holding register 9. Setting holding register to the value of 2 causes all following read/write to array parameters to be to the index 2.

5.9.4 Text Blocks

Parameters stored as text strings are accessed in the same way as the other parameters. The maximum text block size is 20 characters. If a read request for a parameter is for more characters than the parameter stores, the response is truncated. If the read request for a parameter is for fewer characters than the parameter stores, the response is space filled.

5.9.5 Conversion Factor

A parameter value can only be transferred as a whole number. To transfer decimals, use a conversion factor.

5.9.6 Parameter Values

Standard data types

Standard data types are int 16, int 32, uint 8, uint 16, and uint 32. They are stored as 4x registers (40001–4FFFF). The parameters are read using function 03 hex read holding registers. Parameters are written using the function 6 hex preset single register for 1 register (16 bits), and the function 10 hex preset multiple registers for 2 registers (32 bits). Readable sizes range from 1 register (16 bits) up to 10 registers (20 characters).

Non-standard data types

Non-standard data types are text strings and are stored as 4x registers (40001–4FFFF). The parameters are read using function 03 hex read holding registers and written using function 10 hex preset multiple registers. Readable sizes range from 1 register (2 characters) up to 10 registers (20 characters).

5.10 Examples

The following examples show various Modbus RTU commands.

5.10.1 Read Coil Status (01 hex)

Description

This function reads the ON/OFF status of discrete outputs (coils) in the frequency converter. Broadcast is never supported for reads.

Query

The query telegram specifies the starting coil and quantity of coils to be read. Coil addresses start at 0, that is, coil 33 is addressed as 32.

Example of a request to read coils 33–48 (status word) from slave device 01.

Field name	Example (hex)
Slave address	01 (frequency converter address)
Function	01 (read coils)
Starting address HI	00
Starting address LO	20 (32 decimals) coil 33
Number of points HI	00
Number of points LO	10 (16 decimals)
Error check (CRC)	–

Table 5.22 Query

Response

The coil status in the response telegram is packed as 1 coil per bit of the data field. Status is indicated as: 1 = ON; 0 = OFF. The lsb of the 1st data byte contains the coil addressed in the query. The other coils follow toward the high-order end of this byte, and from low order to high order in subsequent bytes.

If the returned coil quantity is not a multiple of 8, the remaining bits in the final data byte are padded with values 0 (toward the high-order end of the byte). The byte count field specifies the number of complete bytes of data.

Field name	Example (hex)
Slave address	01 (frequency converter address)
Function	01 (read coils)
Byte count	02 (2 bytes of data)
Data (coils 40–33)	07
Data (coils 48–41)	06 (STW = 0607hex)
Error check (CRC)	–

Table 5.23 Response

NOTICE

Coils and registers are addressed explicitly with an offset of -1 in Modbus.

For example, coil 33 is addressed as coil 32.

5.10.2 Force/Write Single Coil (05 hex)

Description

This function forces the coil to either ON or OFF. When broadcast, the function forces the same coil references in all attached slaves.

Query

The query telegram specifies the coil 65 (parameter write control) to be forced. Coil addresses start at 0, that is, coil 65 is addressed as 64. Force data = 00 00 hex (OFF) or FF 00 hex (ON).

Field name	Example (hex)
Slave address	01 (frequency converter address)
Function	05 (write single coil)
Coil address HI	00
Coil address LO	40 (64 decimal) Coil 65
Force data HI	FF
Force data LO	00 (FF 00 = ON)
Error check (CRC)	–

Table 5.24 Query

Response

The normal response is an echo of the query, returned after the coil state has been forced.

Field name	Example (hex)
Slave address	01
Function	05
Force data HI	FF
Force data LO	00
Quantity of coils HI	00
Quantity of coils LO	01
Error check (CRC)	–

Table 5.25 Response

5.10.3 Force/Write Multiple Coils (0F hex)

Description

This function forces each coil in a sequence of coils to either on or off. When broadcasting, the function forces the same coil references in all attached slaves.

Query

The query telegram specifies the coils 17–32 (speed setpoint) to be forced.

NOTICE

Coil addresses start at 0, that is, coil 17 is addressed as 16.

Field name	Example (hex)
Slave address	01 (frequency converter address)
Function	0F (write multiple coils)
Coil address HI	00
Coil address LO	10 (coil address 17)
Quantity of coils HI	00
Quantity of coils LO	10 (16 coils)
Byte count	02
Force data HI (Coils 8–1)	20
Force data LO (Coils 16–9)	00 (reference = 2000 hex)
Error check (CRC)	–

Table 5.26 Query

Response

The normal response returns the slave address, function code, starting address, and quantity of coils forced.

Field name	Example (hex)
Slave address	01 (frequency converter address)
Function	0F (write multiple coils)
Coil address HI	00
Coil address LO	10 (coil address 17)
Quantity of coils HI	00
Quantity of coils LO	10 (16 coils)
Error check (CRC)	–

Table 5.27 Response

5.10.4 Read Holding Registers (03 hex)

Description

This function reads the contents of holding registers in the slave.

Query

The query telegram specifies the starting register and quantity of registers to be read. Register addresses start at 0, that is, registers 1–4 are addressed as 0–3.

Example: Read *parameter 3-03 Maximum Reference*, register 03030.

Field name	Example (hex)
Slave address	01
Function	03 (Read holding registers)
Starting address HI	0B (Register address 3029)
Starting address LO	D5 (Register address 3029)
Number of points HI	00
Number of points LO	02 – (<i>parameter 3-03 Maximum Reference</i> is 32 bits long, that is, 2 registers)
Error check (CRC)	–

Table 5.28 Query

Response

The register data in the response telegram is packed as 2 bytes per register, with the binary contents right justified within each byte. For each register, the 1st byte contains the high-order bits, and the 2nd contains the low-order bits.

Example: hex 000088B8 = 35.000 = 35 Hz.

Field name	Example (hex)
Slave address	01
Function	03
Byte count	04
Data HI (register 3030)	00
Data LO (register 3030)	16
Data HI (register 3031)	E3
Data LO (register 3031)	60
Error check (CRC)	–

Table 5.29 Response

5.10.5 Preset Single Register (06 hex)

Description

This function presets a value into a single holding register.

Query

The query telegram specifies the register reference to be preset. Register addresses start at 0, that is, register 1 is addressed as 0.

Example: Write to *parameter 1-00 Configuration Mode*, register 1000.

Field name	Example (hex)
Slave address	01
Function	06
Register address HI	03 (register address 999)
Register address LO	E7 (register address 999)
Preset data HI	00
Preset data LO	01
Error check (CRC)	–

Table 5.30 Query

Response

The normal response is an echo of the query, returned after the register contents have been passed.

Field name	Example (hex)
Slave address	01
Function	06
Register address HI	03
Register address LO	E7
Preset data HI	00
Preset data LO	01
Error check (CRC)	–

Table 5.31 Response

5.10.6 Preset Multiple Registers (10 hex)

Description

This function presets values into a sequence of holding registers.

Query

The query telegram specifies the register references to be preset. Register addresses start at 0, that is, register 1 is addressed as 0. Example of a request to preset 2 registers (set *parameter 1-24 Motor Current* to 738 (7.38 A)):

Field name	Example (hex)
Slave address	01
Function	10
Starting address HI	04
Starting address LO	07
Number of registers HI	00
Number of registers LO	02
Byte count	04
Write data HI (Register 4: 1049)	00
Write data LO (Register 4: 1049)	00
Write data HI (Register 4: 1050)	02
Write data LO (Register 4: 1050)	E2
Error check (CRC)	–

Table 5.32 Query

Response

The normal response returns the slave address, function code, starting address, and quantity of registers preset.

Field name	Example (hex)
Slave address	01
Function	10
Starting address HI	04
Starting address LO	19
Number of registers HI	00
Number of registers LO	02
Error check (CRC)	–

Table 5.33 Response

5.11 Danfoss FC Control Profile

5.11.1 Control Word According to FC Profile (8-10 Protocol = FC Profile)

Illustration 5.13 Control Word According to FC Profile

Bit	Bit value = 0	Bit value = 1
00	Reference value	External selection lsb
01	Reference value	External selection msb
02	DC brake	Ramp
03	Coasting	No coasting
04	Quick stop	Ramp
05	Hold output frequency	Use ramp
06	Ramp stop	Start
07	No function	Reset
08	No function	Jog
09	Ramp 1	Ramp 2
10	Data invalid	Data valid
11	Relay 01 open	Relay 01 active
12	Relay 02 open	Relay 02 active
13	Parameter set-up	Selection lsb
15	No function	Reverse

Table 5.34 Control Word According to FC Profile

Explanation of the control bits

Bits 00/01

Bits 00 and 01 are used to select among the 4 reference values, which are preprogrammed in *parameter 3-10 Preset Reference* according to Table 5.35.

Programmed reference value	Parameter	Bit 01	Bit 00
1	<i>Parameter 3-10 Preset Reference</i> [0]	0	0
2	<i>Parameter 3-10 Preset Reference</i> [1]	0	1
3	<i>Parameter 3-10 Preset Reference</i> [2]	1	0
4	<i>Parameter 3-10 Preset Reference</i> [3]	1	1

Table 5.35 Control Bits

NOTICE

In *parameter 8-56 Preset Reference Select*, define how bit 00/01 gates with the corresponding function on the digital inputs.

Bit 02, DC brake

Bit 02 = 0: Leads to DC braking and stop. Set braking current and duration in *parameter 2-01 DC Brake Current* and *parameter 2-02 DC Braking Time*.

Bit 02 = 1: Leads to ramping.

Bit 03, Coasting

Bit 03 = 0: The frequency converter immediately releases the motor (the output transistors are shut off), and it coasts to a standstill.

Bit 03 = 1: If the other starting conditions are met, the frequency converter starts the motor.

In *parameter 8-50 Coasting Select*, define how bit 03 gates with the corresponding function on a digital input.

Bit 04, Quick stop

Bit 04 = 0: Makes the motor speed ramp down to stop (set in *parameter 3-81 Quick Stop Ramp Time*).

Bit 05, Hold output frequency

Bit 05 = 0: The present output frequency (in Hz) freezes. Change the frozen output frequency only with the digital inputs programmed to [21] *Speed up* and [22] *Speed down* (*parameter 5-10 Terminal 18 Digital Input* to *parameter 5-13 Terminal 29 Digital Input*).

NOTICE

If freeze output is active, the frequency converter can only be stopped in 1 of the following ways:

- Bit 03 coast stop.
- Bit 02 DC brake.
- Digital input programmed to [5] *DC brake inverse*, [2] *Coast inverse*, or [3] *Coast and reset inv* (*parameter 5-10 Terminal 18 Digital Input* to *parameter 5-13 Terminal 29 Digital Input*).

Bit 06, Ramp stop/start

Bit 06 = 0: Causes a stop and makes the motor speed ramp down to stop via the selected ramp-down parameter.

Bit 06 = 1: If the other starting conditions are met, bit 06 allows the frequency converter to start the motor.

In *parameter 8-53 Start Select*, define how bit 06 ramp stop/start gates with the corresponding function on a digital input.

Bit 07, Reset

Bit 07 = 0: No reset.

Bit 07 = 1: Resets a trip. Reset is activated on the leading signal edge, that is, when changing from logic 0 to logic 1.

Bit 08, Jog

Bit 08 = 1: *Parameter 3-11 Jog Speed [Hz]* determines the output frequency.

Bit 09, Selection of ramp 1/2

Bit 09 = 0: Ramp 1 is active (*parameter 3-41 Ramp 1 Ramp Up Time* to *parameter 3-42 Ramp 1 Ramp Down Time*).

Bit 09 = 1: Ramp 2 (*parameter 3-51 Ramp 2 Ramp Up Time* to *parameter 3-52 Ramp 2 Ramp Down Time*) is active.

Bit 10, Data not valid/Data valid

Tell the frequency converter whether to use or ignore the control word.

Bit 10 = 0: The control word is ignored.

Bit 10 = 1: The control word is used. This function is relevant because the telegram always contains the control word, regardless of the telegram type. If the control word is not needed when updating or reading parameter, turn it off.

Bit 11, Relay 01

Bit 11 = 0: Relay not activated.

Bit 11 = 1: Relay 01 activated if [36] *Control word bit 11* is selected in *parameter 5-40 Function Relay*.

Bit 12, Relay 02

Bit 12 = 0: Relay 02 is not activated.

Bit 12 = 1: Relay 02 is activated if [37] *Control word bit 12* is selected in *parameter 5-40 Function Relay*.

Bit 13, Set-up selection

Use bit 13 to select from the 2 menu set-ups according to *Table 5.36*.

Set-up	Bit 13
1	0
2	1

Table 5.36 Menu Set-ups

The function is only possible when [9] *Multi set-ups* is selected in *parameter 0-10 Active Set-up*.

To define how bit 13 gates with the corresponding function on the digital inputs, use *parameter 8-55 Set-up Select*.

Bit 15 Reverse

Bit 15 = 0: No reversing.

Bit 15 = 1: Reversing. In the default setting, reversing is set to digital in *parameter 8-54 Reversing Select*. Bit 15 causes reversing only when serial communication, [2] *Logic OR* or [3] *Logic AND* is selected.

5.11.2 Status Word According to FC Profile (STW)

Set parameter 8-30 Protocol to [0] FC.

Illustration 5.14 Status Word

Bit	Bit=0	Bit=1
00	Control not ready	Control ready
01	Frequency converter not ready	Frequency converter ready
02	Coasting	Enable
03	No error	Trip
04	No error	Error (no trip)
05	Reserved	–
06	No error	Triplock
07	No warning	Warning
08	Speed≠reference	Speed=reference
09	Local operation	Bus control
10	Out of frequency limit	Frequency limit OK
11	No operation	In operation
12	Frequency converter OK	Stopped, auto start
13	Voltage OK	Voltage exceeded
14	Torque OK	Torque exceeded
15	Timer OK	Timer exceeded

Table 5.37 Status Word According to FC Profile

Explanation of the status bits

Bit 00, Control not ready/ready

Bit 00=0: The frequency converter trips.

Bit 00=1: The frequency converter controls are ready but the power component does not necessarily receive any supply (if there is 24 V external supply to controls).

Bit 01, Frequency converter ready

Bit 01=0: The frequency converter is not ready.

Bit 01=1: The frequency converter is ready for operation, but the coasting command is active via the digital inputs or via serial communication.

Bit 02, Coast stop

Bit 02=0: The frequency converter releases the motor.

Bit 02=1: The frequency converter starts the motor with a start command.

Bit 03, No error/trip

Bit 03=0: The frequency converter is not in fault mode.

Bit 03=1: The frequency converter trips. To re-establish operation, press [Reset].

Bit 04, No error/error (no trip)

Bit 04=0: The frequency converter is not in fault mode.

Bit 04=1: The frequency converter shows an error but does not trip.

Bit 05, Not used

Bit 05 is not used in the status word.

Bit 06, No error/triplock

Bit 06=0: The frequency converter is not in fault mode.

Bit 06=1: The frequency converter is tripped and locked.

Bit 07, No warning/warning

Bit 07=0: There are no warnings.

Bit 07=1: A warning has occurred.

Bit 08, Speed reference/speed=reference

Bit 08=0: The motor runs, but the present speed is different from the preset speed reference. It might happen when the speed ramps up/down during start/stop.

Bit 08=1: The motor speed matches the preset speed reference.

Bit 09, Local operation/bus control

Bit 09=0: [Off/Reset] is activated on the control unit or [2] Local in parameter 3-13 Reference Site is selected. It is not possible to control the frequency converter via serial communication.

Bit 09=1: It is possible to control the frequency converter via the fieldbus/serial communication.

Bit 10, Out of frequency limit

Bit 10=0: The output frequency has reached the value in parameter 4-12 Motor Speed Low Limit [Hz] or parameter 4-14 Motor Speed High Limit [Hz].

Bit 10=1: The output frequency is within the defined limits.

Bit 11, No operation/in operation

Bit 11=0: The motor is not running.

Bit 11=1: The frequency converter has a start signal without coast.

Bit 12, Frequency converter OK/stopped, auto start

Bit 12=0: There is no temporary overtemperature on the frequency converter.

Bit 12=1: The frequency converter stops because of overtemperature, but the unit does not trip and resumes operation once the overtemperature normalizes.

Bit 13, Voltage OK/limit exceeded

Bit 13=0: There are no voltage warnings.

Bit 13=1: The DC voltage in the frequency converter's DC link is too low or too high.

Bit 14, Torque OK/limit exceeded

Bit 14=0: The motor current is lower than the current limit selected in parameter 4-18 Current Limit.

Bit 14=1: The current limit in parameter 4-18 Current Limit is exceeded.

Bit 15, Timer OK/limit exceeded

Bit 15=0: The timers for motor thermal protection and thermal protection are not exceeded 100%.

Bit 15=1: 1 of the timers exceed 100%.

5.11.3 Bus Speed Reference Value

Speed reference value is transmitted to the frequency converter in a relative value in %. The value is transmitted in the form of a 16-bit word. The integer value 16384 (4000 hex) corresponds to 100%. Negative figures are formatted using 2's complement. The actual output frequency (MAV) is scaled in the same way as the bus reference.

Illustration 5.15 Actual Output Frequency (MAV)

The reference and MAV are scaled as follows:

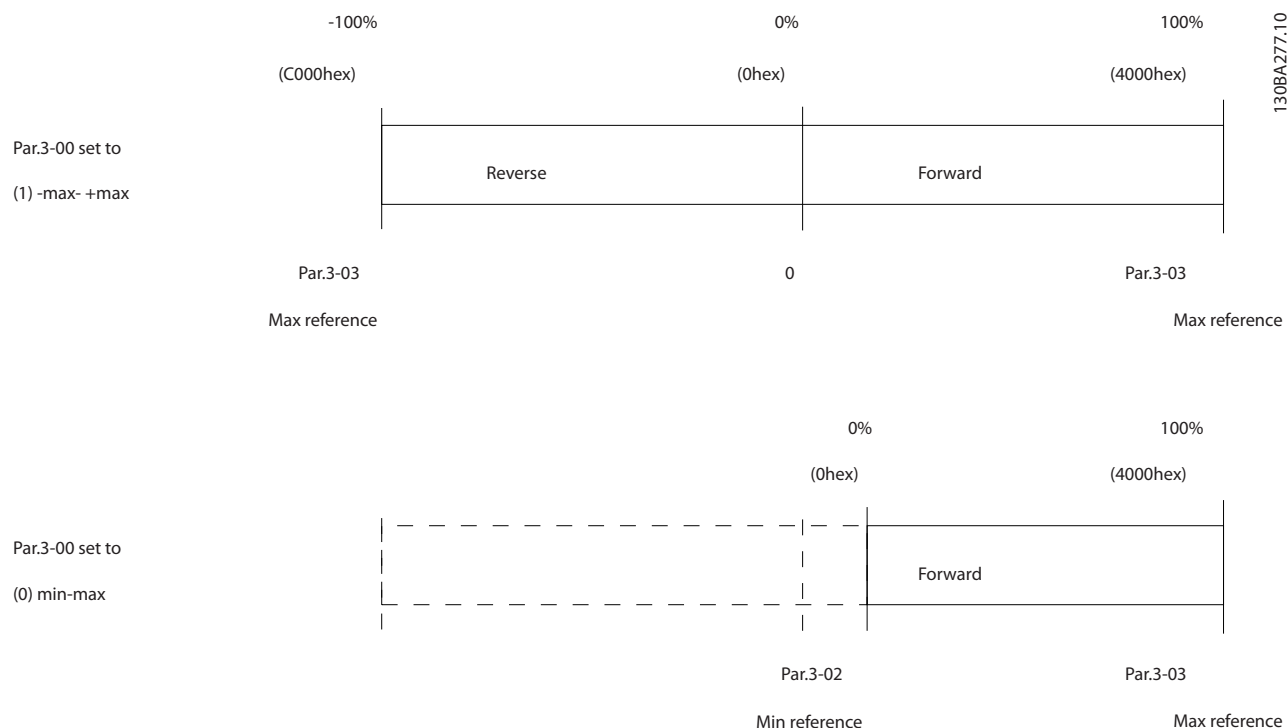

Illustration 5.16 Reference and MAV

6 Application Examples

6.1 Introduction

The examples in this section are intended as a quick reference for common applications.

- Parameter settings are the regional default values unless otherwise indicated (selected in *parameter 0-03 Regional Settings*).
- Parameters associated with the terminals and their settings are shown next to the drawings.
- Required switch settings for analog terminals 53 or 54 are also shown.

6.1.5 Motor Thermistor

NOTICE

To meet PELV insulation requirements, use reinforced or double insulation on the thermistors.

Parameters	
Function	Setting
Parameter 1-90 Motor Thermal Protection	[2] Thermistor trip
Parameter 1-93 Thermistor Source	[1] Analog input 53
Parameter 6-19 Terminal 53 mode	*[1] Voltage
* = Default value	
Notes/comments:	
If only a warning is needed, set parameter 1-90 Motor Thermal Protection to [1] Thermistor warning.	

Table 6.8 Motor Thermistor

Parameters	
Function	Setting
Parameter 4-30 Motor Feedback Loss Function	[1] Warning
Parameter 4-31 Motor Feedback Speed Error	100
Parameter 4-32 Motor Feedback Loss Timeout	5 s
Parameter 7-00 Speed PID Feedback Source	[2] MCB 102
Parameter 17-11 Resolution (PPR)	1024*
Parameter 13-00 SL Controller Mode	[1] On
Parameter 13-01 Start Event	[19] Warning
Parameter 13-02 Stop Event	[44] Reset key
Parameter 13-10 Comparator Operand	[21] Warning no.
Parameter 13-11 Comparator Operator	[1] ≈*
Parameter 13-12 Comparator Value	90
Parameter 13-51 SL Controller Event	[22] Comparator 0
Parameter 13-52 SL Controller Action	[32] Set digital out A low
Parameter 5-40 Frequency Unction Relay	[80] SL digital output A
*=Default value	
Notes/comments:	
If the limit in the feedback monitor is exceeded, warning 90 feedback monitor is issued. The SLC monitors warning 90 feedback monitor. If warning 90 feedback monitor becomes true, relay 1 is triggered. External equipment could indicate that service is required. If the feedback error goes below the limit again within 5 s, the frequency converter continues and the warning disappears. But relay 1 persists until [Off/Reset] is pressed.	

Table 6.9 Using SLC to Set a Relay

6.1.6 Encoder Connection

The purpose of this guideline is to ease the set-up of encoder connection to the frequency converter. Before setting up the encoder, the basic settings for a closed-loop speed control system are shown.

Illustration 6.2 24 V or 10-30 V Encoder

Illustration 6.3 24 V Incremental Encoder, Maximum Cable Length 5 m (16.4 ft)

6.1.7 Encoder Direction

The order in which the pulses enter the frequency converter determines the direction of the encoder. Clockwise direction means that channel A is 90 electrical degrees before channel B. Counterclockwise direction means that channel B is 90 electrical degrees before A. The direction is determined by looking into the shaft end.

6.1.8 Closed-loop Drive System

A drive system usually consists of more elements such as:

- Motor.
- Brake (gearbox, mechanical brake).
- Frequency converter.
- Encoder as feedback system.
- Brake resistor for dynamic brake.
- Transmission.
- Load.

Applications demanding mechanical brake control usually need a brake resistor.

Input signal.....	19	Motor power.....	16
Inputs		Motor voltage.....	60
Analog input.....	7, 8	Multiple frequency converters.....	17
Analog inputs.....	56	N	
Digital input.....	23	Network configuration.....	74
Digital inputs.....	55	Network connection.....	68
Pulse inputs.....	56	Noise isolation.....	16
Intermediate circuit.....	47, 60	O	
Intermittent duty cycle.....	8	Open loop.....	57
Internal current control, VVC+ mode.....	23	Optional equipment.....	17
Isolated mains.....	17	Output current.....	57
J		Outputs	
Jog.....	7, 83	Analog output.....	8
L		P	
LCP.....	6, 8, 23	Parameter number (PNU).....	71
LCP control keys.....	23	PELV.....	57, 88
Leakage current.....	42	PELV, protective extra low voltage.....	42
Low Voltage Directive.....	11	Power connection.....	16
M		Power cycle.....	8
Machinery Directive.....	11	Power factor.....	17
Mains		Preset reference.....	26
drop-out.....	47	Process PID control.....	33
supply.....	8	Protection.....	42
supply data.....	52	Protection and feature.....	58
Supply (L1, L2, L3).....	55	Pulse feedback.....	26
Mechanical holding brake.....	43	Pulse reference.....	7, 26
Modbus communication.....	68	R	
Modbus exception code.....	78	Rated motor current.....	7
Modbus RTU.....	74	Rated motor speed.....	7
Modbus RTU commands.....	79	RCD.....	9
Modbus RTU overview.....	73	Read coil.....	79
Moment of inertia.....	47	Read holding registers (03 hex).....	81
		Reference limit.....	25
		Registers.....	79
		Relay output.....	57
		Reset.....	58

Reset alarm.....	23
RFI filter.....	17
Rise time.....	60
RS485	
RS485.....	67, 69
installation and set-up.....	67

S

Safety precaution.....	9
Serial communication.....	7, 19
Shielded cable.....	16
Shielded control cable.....	19
Short circuit.....	46
Slip compensation.....	9
Special conditions.....	62
Speed PID.....	20, 22
Speed PID control.....	30
Speed reference.....	86
Static overload in VVC+ mode.....	47
Status word.....	84
Supply voltage.....	56
Switching on the output.....	46
Synchronous motor speed.....	7

T

Telegram length (LGE).....	70
Terminal programming.....	19
Thermistor.....	9, 88
Torque	
characteristic.....	55
Torque control.....	20
Trip.....	9

V

Voltage level.....	55
VVC+.....	9, 22

W

Wire size.....	16
