1. Introduction to VLT 3000 to VLT FC 302 Converter

1.1. Introduction to VLT 3000 to VLT FC 302 Converter

1.1.1. Software version

1.1.2. Introduction

This VLT 3000 to FC 302 converter is a tool intended for the conversion of a VLT 3000 to a FC 302, which replaces the VLT 3000. The conversion is possible for all VLT 3000's with the serial numbers from XXXXXXG265. To purchase (obligatory): - FC 302 130B1245 - with Software version 4.35 or Higher. For Mechanical adaption, several adapter plates are available. For VLT 3002-3004 Compact IP00, ordering number 130B0056. For VLT 3002-3004 Compact IP00 with Brake ordering number 130B0058

Please notify some parameters in the VLT 3000 are not supported in the FC 302 and some FC 302 parameters can not be accessed via the Profibus converter Option.

1.1.3. Configuration

With the Profibus converter software the FC 302 will react on the Profibus network as a VLT 3000; it means that it is not necessary to change anything in the PLC programme. A write command to for example ramp up time in VLT 3000 is automatically linked to the corresponding ramp up time parameter in FC 302.

Please note that the converter software will only work on a Profibus DP Norm network. It will not work on a Sinec L2 or a Siemens DP network. You can check your Profibus network either by the VLT 3000 or by the master.

1

IM 308-B ver. 6 IM 308-C This master supports Profibus DP Norm This master supports Profibus DP Norm

We support Profibus DP Norm by VLT 3000 with a software version that should be higher than version 3.00. The software version number can be read out in parameter 603, choice 3. The master must be a Profibus DP Norm master. If a master from Siemens S5 series is used the master must be an IM-308C or IM-308B and higher or equal to version 6. All Siemens S7 series are Profibus DP Norm.

1.1.4. Setup up of the converter software

Before VLT 3000 can be replaced with a FC302 only the station address needs to be setup in the FC 302. Ensure that the parameters in the below table have the same setting in FC 302 as in VLT 3000.

VLT 3000	FC 302
Par. 820 Baud Rate	Autodetect (see par. 963)
Par. 904 PPO type	Autodetect (see par. 922)
Par. 918 Station Address	Par. 918 Station Address or via DIP switch

Table 1.1: Settings

After copying the station address from the VLT 3000 to the FC 302, power must be re-cycled to the FC 302 as this parameter is only valid after power up. The master should now recognize FC302. The two LEDs in the front of the Profibus card should now be solid green which indicates that communication between master and slave is established.

If the Net Status LED flashes, the master has not recognized the FC 302. Check if Baud rate, PPO type and station address are the same in the FC 302 as the VLT 3000.

1.1.5. Bus Connection

NB!
VLT 5000 has other physical connections compared to VLT 3000.

Illustration 1.1:

Illustration 1.2:

RPM

NB!
The VLT 3000 converter sets Parameter 0-02 to Hz mode at power-up. This is done to secure proper operation of the converter software. The user should not change this, since it would lead to malfunction of the system.

Digital Inputs 16/ 17

NB!
The FC 302 has a reduced number of Digital I/O compared to the VLT 3000. If all inputs of the VLT 3000 are being used, an additional option board MCB 101 is needed. The MCB 101 adds Digital input and Outputs to the FC 302.

Current/ Voltage Selection on Analog Inputs

NB!
The VLT 3000 has two analogue inputs - one voltage and one current. The FC 302 has two analogue inputs, which can be set to *Current* and *Voltage* via two small DIP switches on the control card. Factory setting is *Voltage* in both cases.

1.1.6. Mapping List

1

The below listed VLT 3000 parameters in the left column have the corresponding FC 302 parameters as shown in the right column. Please be notify that the opposite is not the case. the FC 302 series using the LCP.

VLT 3000		FC300	
Par. no	Par. Name	Par. no	Par. Name
