Danfoss

Installation Instructions VLT[®] Encoder Option MCB 102 VLT[®]AutomationDrive FC 301/FC 302

Introduction

The VLT[®] Encoder Option MCB 102 can be used as feedback source for closed-loop control or as master source for synchronizing control. Configure the encoder option in *parameter group 17-** Feedback Option*, see the VLT[®] AutomationDrive FC 301/FC 302 Programming Guide.

Signal type	5 V TTL, RS422 1 Vpp, SinCos		
Maximum resolution	16.384 pulses/revolution		
Maximum frequency	410 kHz		

Table 1.1 Supported Incremental Encoder Types

SSI without incremental track	Data length 13–32 bits, clock rate
SSI with SinCos	100–260 kHz
SSI with TTL	
Hiperface with incremental track	Resolution 8192-1.073.741.824
	positions/revolution, multiturn 1-
	16,777,216 revolutions, Baudrate
	600–38400
EnDat 2.1 and 2.2 without	Maximum data length 64 bit,
incremental track	Clock rate 100–260 kHz
EnDat 2.1 and 2.2 with SinCos	
EnDat 2.1 and 2.2 with TTL	

Table 1.2 Supported Absolute Single and Multi-turn Encoder Types

Maximum cross-section, flexible/rigid wire	1.5 mm ² /16 AWG
without cable end sleeves	
Maximum cross-section, flexible wire with cable	0.75 mm ² /18 AWG
end sleeves with collar	
Minimum cross-section	0.2 mm ² /26 AWG

Items Supplied

• VLT[®] Encoder Option MCB 102

Ordering numbers

- 130B1115 (uncoated)
- 130B1203 (coated)

Safety

DISCHARGE TIME

The frequency converter contains DC-link capacitors, which can remain charged even when the frequency converter is not powered. High voltage can be present even when the warning LED indicator lights are off. Failure to wait the specified time after power has been removed before performing service or repair work can result in death or serious injury.

- Stop the motor.
- Disconnect AC mains and remote DC-link power supplies, including battery back-ups, UPS, and DClink connections to other frequency converters.
- Disconnect or lock PM motor.
- Wait for the capacitors to discharge fully. The minimum duration of waiting time is specified in *Table 1.4* and is also visible on the product label on top of the frequency converter.
- Before performing any service or repair work, use an appropriate voltage measuring device to make sure that the capacitors are fully discharged.

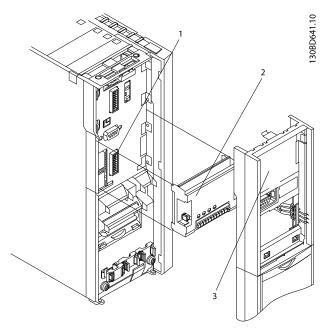

Voltage [V]	Minimum waiting time (minutes)				
	4	7	15		
200–240	0.25–3.7 kW	-	5.5–37 kW		
	(0.34–5 hp)		(7.5–50 hp)		
380–500	0.25–7.5 kW	-	11–75 kW		
	(0.34–10 hp)		(15–100 hp)		
525-600	0.75–7.5 kW	-	11–75 kW		
	(1–10 hp)		(15–100 hp)		
525-690	-	1.5–7.5 kW	11–75 kW		
		(2–10 hp)	(15–100 hp)		

Table 1.4 Discharge Time

Danfoss

Mounting

Mount the option according to *Illustration 1.1*.

Electrical Installation

NOTICE

Supply the encoder through the VLT[®] Encoder Option MCB 102. Avoid using external supply for the encoder.

Encoder monitor

The 4 encoder channels (A, B, Z, and D) are monitored, open, and short circuits can be detected. There is a green LED for each channel which lights up when the channel is OK.

NOTICE

To view the LEDs on the option, remove the cover. Select response to encoder errors in *parameter 17-61 Feedback Signal Monitoring*.

NOTICE

Maximum cable length for incremental encoder 150 m [492 ft].

Set-up and Connection

VLT[®] AutomationDrive FC 301/FC 302 with VLT[®] Encoder Option MCB 102 supports multiple encoder configurations which can be used as speed and/or position feedback for closed-loop flux motor control, closed-loop speed control, and closed-loop position control:

- Select [2] MCB 102 as "Flux Motor Feedback Source" in parameter 1-02 Flux Motor Feedback Source.
- Select [0] Motor feedb. P1-02 or [2] MCB 102 as "Speed PID Feedback Source" in parameter 7-00 Speed PID Feedback Source.
- Select [0] Motor feedb. P1-02 or [2] MCB 102 as "Position PI Feedback Source" in parameter 7-90 Position PI Feedback Source

Incremental Encoders

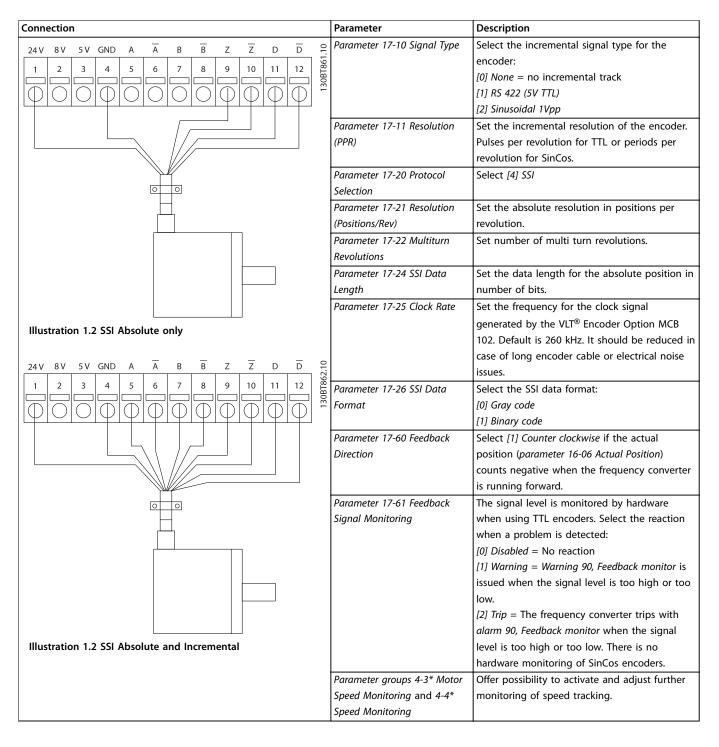

With TTL and SinCos Incremental encoder, the actual position is 0 after power-up and encoder pulses are counted to increment/ decrement actual position. For improved resolution with TTL encoders, both the positive and negative edges of A and B pulses are detected giving 4 quad counts per encoder pulse. With SinCos encoders, the signal is sampled 1024 times per sine-cosine period meaning that the resulting resolution is 1024 times periods per revolution.

Connection	Parameter	Description
$\begin{array}{c} 24V & 8V & 5V & \text{GND} A \overline{A} B \overline{B} Z \overline{Z} D \overline{D} \\ \hline 1 2 3 4 5 6 7 8 9 10 11 12 \\ \hline 0 0 0 0 0 0 0 0 0 0$	Parameter 17-10 Signal Type Parameter 17-11 Resolution (PPR)	Select the signal type for the encoder: [1] RS 422 (5V TTL) [2] Sinusoidal 1Vpp Set the resolution of the encoder. Pulses per revolution for TTL or periods per revolution for
	Parameter 17-60 Feedback Direction	SinCos. Select [1] Counter clockwise if actual position (parameter 16-06 Actual Position) counts negative when the frequency converter is running forward. Alternative is to swap A and B
Illustration 1.2 Incremental Encoder	Parameter 17-61 Feedback Signal Monitoring	track on the encoder connection. The signal level is monitored by hardware when using TTL encoders. Select the reaction when a problem is detected: [0] Disabled = No reaction [1] Warning = Warning 90, Feedback monitor is issued when the signal level is too high or too low. [2] Trip = The frequency converter trips with alarm 90, Feedback monitor when the signal
	Parameter groups 4-3* Motor Speed Monitoring and 4-4* Speed Monitoring	level is too high or too low. There is no hardware monitoring of SinCos encoders. Offer possibility to activate and adjust further monitoring of speed tracking.

SSI Encoders

Absolute position is read from the encoder and used to set the actual position after power-up. Thereafter, the absolute position is read every 1 ms and used to track any movements. If the absolute position read from the encoder changes more than half an encoder revolution from the previous position, it is considered to be invalid and the position value is not used. Up to 4 consecutive invalid positions are skipped, 5 consecutive invalid positions trigger an error, the reaction to this error depends on the setting of *parameter 17-61 Feedback Signal Monitoring*. If no reaction or only warning is selected, up to 10 consecutive invalid positions are skipped where after the position is considered valid and thus used.

When an incremental track is added, it is used for tracking movements while the absolute position readings are used to monitor, and if needed, correct any deviations between the 2 tracks. A warning is issued when the actual position based on the incremental track deviates more than 3 qc from the absolute position.

Danfoss

Hiperface Encoders

Absolute position is read from the encoder and used to set the actual position after power-up. Thereafter, the incremental track is used for tracking movements while the absolute position readings are used to monitor and if needed correct any deviations between the 2 tracks. A warning is issued when the actual position based on the incremental track deviates more than 3 qc from the absolute position.

EnDat Encoders

Absolute only

Absolute position is read from the encoder and used to set the actual position after power-up. Thereafter, the absolute position is read every 1 ms and used to track any movements.

Absolute and incremental

Absolute position is read from the encoder and used to set the actual position after power-up. Thereafter, the incremental track Is used for tracking movements while the absolute position readings are used to monitor, and if needed, correct any deviations between the 2 tracks. A warning is issued when the actual position based on the incremental track deviates more than 3 qc from the absolute position.
