

<u> Danfoss</u>

The controller is provided with signs from the factory indicating application 1. If you employ another use, signs are provided so that you can mount the relevant one.

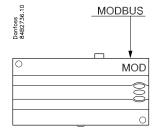

ī

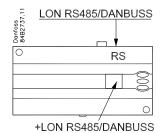

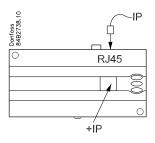

Danfoss

#### **Data communication**

**Important** All connections to the data communication MODBUS and RS 485 must comply with the requirements for data communication cables. See literature: RC8AC.

#### DI1

Digital input signal.

The defined function is active when the input is short-circuited/ opened. The function is defined in o02.

#### DI2

Digital input signal.

The defined function is active when the input is short-circuited/ opened. The function is defined in o37.

### Pressure transmitter or temperature sensor S1

*Pe / AKS 32R (pressure measurement recommended)* 

Connect to terminal 30, 31 and 32.

The signal from one pressure transmitter can be received by up to 10 controllers. But only if there are no significant pressure decreases between the evaporators to be controlled. *If use with 060G1034 cable, 1=black, 2=blue, 3=brown* 

*S1 (correct location is important to ensure correct measurements)* Pt 1000 ohm sensor

Connect to terminal 31 and 32.

#### **S2**

Pt 1000 ohm sensor

#### S3, S4, S5, S6

Pt 1000 ohm sensor or PTC 1000 ohm sensor. All have to be of the same type.

- S3, air sensor, placed in the warm air before the evaporator
- *S4, air sensor, placed in the cold air after the evaporator* (the need for either S3 or S4 can be deselected in the configuration)
- S5, defrost sensor, placed on the evaporator
- *S6, product sensor or defrost sensor B or air sensor B.* The configuration determines which.

#### 5

## EKA Display

If there is be external reading/operation of the controller, display type EKA 163B or EKA 164B can be connected.

### RS485 (terminal 51, 52, 53)

For data communication, but only if a data communication module is inserted in the controller. The module can be a LON RS485 or a MODBUS. Terminal 51 = screen Terminal 52 = A (A+) Terminal 53 = B (B-) (For LON RS485 and gateway type AKA 245 the gateway must be version 6.20 or higher.)

#### RJ45

For data communication, but only if a TCP/IP module is inserted in the controller. (OEM)

#### MODBUS

For data communication. Terminal 56 = screen Terminal 57 = A+ Terminal 58 = B-(Alternatively the terminals can be connected to an external display type EKA 163A or 164A, but then they cannot be used for data communication. Any data communication must then be carried out by one of the other methods.)

#### Supply voltage

115 V a.c., 50/60 Hz

antos

#### D01

Connection of expansion valve type AKV or AKVA. The coil must be a 115 V a.c. coil.

### DO2

Alarm

There is a connection between terminal 7 and 8 in alarm situations and when the controller is without power.

Rail heat and heating element in drip tray

There is connection between terminal 7 and 9 when heating takes place.

Night blind

There is connection between terminal 7 and 9 when the night blind is up.

Suction line valve

There is connection between terminal 7 and 9 when the suction line must be open.

#### DO3

Refrigeration, Rail heat, Heat function, Defrost 2

There is connection between terminal 10 and 11 when the function must be active.

Heating element in drip tray

There is connection between terminal 10 and 11 when heating takes place.

### D04

#### Defrost

There is connection between terminal 12 and 14 when defrosting takes place.

Hot gas / drain valve

There is connection between terminal 13 and 14 during normal operation.

There is connection between terminal 12 and 14 when the hot gas valves must open.

### D05

#### Fan

There is connection between terminal 15 and 16 when the fan is on.

## D06

Light relay

There is connection between terminal 17 and 18 when the light must be on.

Rail heat, Compressor 2

There is connection between terminal 17 and 19 when the function must be active.

## DI3

Digital indput signal. The signal must have a voltage of 0 / 115 V AC. The function is defined in o84.

#### **Data communication**

If data communication is used, it is important that the installation of the data communication cable is performed correctly. See separate literature No. RC8AC...

#### **Electric noise**

Max. 10

Danfoss 84B2728.

D12

Cables for sensors, DI inputs and data communication **must** be kept separate from other electric cables:

- Use separate cable trays
- Keep a distance between cables of at least 10 cm
- Long cables at the DI input should be avoided

#### Installation considerations

Accidental damage, poor installation, or site conditions, can give rise to malfunctions of the control system, and ultimately lead to a plant breakdown.

Every possible safeguard is incorporated into our products to prevent this. However, a wrong installation, for example, could still present problems. Electronic controls are no substitute for normal, good engineering practice.

Danfoss wil not be responsible for any goods, or plant components, damaged as a result of the above defects. It is the installer's responsibility to check the installation thoroughly, and to fit the necessary safety devices.

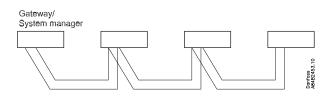

Special reference is made to the necessity of signals to the controller when the compressor is stopped and to the need of liquid receivers before the compressors.

Your local Danfoss agent will be pleased to assist with further advice, etc.

Coordinated defrost via data communication

Coordinated defrost via

cable connections

] []

EEÉF

The following controllers can be connected up in this way: EKC 204A, AK-CC 210, AK-CC 250, AK-CC 450, AK-CC 550,

Refrigeration is resumed when all controllers have "released" the signal for defrost.

The setting of controllers to coordinate their defrosting takes place in the gateway/system manager.

Refrigeration is resumed when all controllers have "released" the signal for defrost.

Janfos

## Operation

#### Display

The values will be shown with three digits, and with a setting you can determine whether the temperature is to be shown in  $^{\circ}$ C or in  $^{\circ}$ F.

#### Light-emitting diodes (LED) on front panel

The LED's on the front panel will light up when the relevant relay is activated.

- Refrigeration
- 😤 = Defrost
- 🖶 = Fan running

The light-emitting diodes will flash when there is an alarm. In this situation you can download the error code to the display and cancel/sign for the alarm by giving the top button a brief push.

#### The buttons

When you want to change a setting, the upper and the lower buttons will give you a higher or lower value depending on the button you are pushing. But before you change the value, you must have access to the menu. You obtain this by pushing the upper button for a couple of seconds - you will then enter the column with parameter codes. Find the parameter code you want to change and push the middle buttons until value for the parameter is shown. When you have changed the value, save the new value by once more pushing the middle button.

#### Examples

#### Set menu

- 1. Push the upper button until a parameter r01 is shown
- 2. Push the upper or the lower button and find that parameter you want to change
- 3. Push the middle button until the parameter value is shown
- 4. Push the upper or the lower button and select the new value
- 5. Push the middle button again to freeze the value.

#### Cutout alarm relay / receipt alarm/see alarm code

- A short press of the upper button
- If there are several alarm codes they are found in a rolling stack. Push the uppermost or lowermost button to scan the rolling stack.

#### Set temperature

1. Push the middle button until the temperature value is shown 2. Push the upper or the lower button and select the new value 3. Push the middle button again to conclude the setting.

Reading the temperature at defrost sensor (Or product sensor, if selected in 092.)

• A short press of the lower button

#### Manuel start or stop of a defrost

• Push the lower button for four seconds.

#### Get a good start

With the following procedure you can start regulation very quick-ly:

- **1** Open parameter r12 and stop the regulation (in a new and not previously set unit, r12 will already be set to 0 which means stopped regulation.)
- **2** Select electrical connection based on the drawings on page 2 and 3
- **3** Open parameter o61 and set the electric connection number in it
- 4 Now select one of the preset settings from the table

thermostat, alarm thermostat and display readings as the sensor uses are predefined.

- **5** Open parameter o62 and set the number for the array of presettings. The few selected settings will now be transferred to the menu.
- **6** Open parameter n57 and select method for measuring of evaporator pressure Pe or S1 (factory setting is Pe pressure transmitter)
- **7** If pressure transmitter Pe is used you must select refrigerant via parameter o30
- 8 Open parameter r12 and start the regulation
- **9** Go through the survey of factory settings. The values in the grey cells are changed according to your choice of settings. Make any necessary changes in the respective parameters.

10 For network. Set the address in o03

- 11 Send address to system unit:
  - MODBUS: Activate scan function in system unit
  - If another data communication card is used in the controller:
  - LON RS485: Activate the function o04

\*) Can only be set when regulation is stopped (r12=0) \*\*) Can be controlled manually, but only when r12=-1 \*\*\*) With access code 2 the access to these menus will be limited

Factory settings are indicated for standard units. Other code numbers have customized settings.

Factory setting If you need to return to the factory-set values, it can be done in this way: - Cut out the supply voltage to the controller - Keep upper and lower button depressed at the same time as you reconnect the supply voltage

Fault message			Operating status		(Measurement)
activated. If you push th report in the display.	LED's on the front will flash and the alarm e top button in this situation you can see t	he alarm	The controller goes through some regulating situa- tions where it is just waiting for the next point of the regulation. To make these "why is nothing happening"		Ctrl. state: (Shown in all menu displays)
ing the daily operation, o A-alarms will not becom E-alarms, on the other he	rror reports - it can either be an alarm occu or there may be a defect in the installation e visible until the set time delay has expire and, will become visible the moment the e	ed. error occurs.	situations visible, you can see an operating status on the display. Push briefly (1s) the upper button. If there is a status code, it will be shown on the display. The indi- vidual status codes have the following meanings:		mena aispiays,
Here are the messages t	isible as long as there is an active E alarm). hat may appear:	•	Normal regulation	S0	0
Code / Alarm text via	Description	Alarm	Waiting for end of the coordinated defrost	S1	1
data communication		relay groups (P41)	When the compressor is operating it must run for at least x minutes.		2
A1/ High t.alarm	High temperature alarm	1	When the compressor is stopped, it must remain stopped for at least x minutes.	S3	3
A2/ Low t. alarm	Low temperature alarm	2	The evaporator drips off and waits for the time to run out	S4	4
A4/ Door alarm	Door alarm	8	Refrigeration stopped by main switch. Either with r12 or a DI-input	S10	10
A5/ Max hold time	The "o16" function is activated during a coordinated defrost	16	Refrigeration stopped by thermostat	S11	11
A10/ Inject prob.	Control problem	64	Defrost sequence. Defrost in progress	S14	14
A11/ No Rfg. sel.	No refrigerant selected	64	Defrost sequence. Fan delay — water attaches to the evaporator	S15	15
A13/ High temp S6	Temperature alarm. High S6	1	Refrigeration stopped due to open ON input or stopped	S16	16
A14/ Low temp S6	Temperature alarm. Low S6	2	regulation	647	47
A15/ DI1 alarm	DI1 alarm	8	Door is open. DI input is open	S17	17
A16/ DI2 alarm	DI2 alarm	8	Melt function in progress. Refrigeration is interrupted	S18	18
A45/ Standby mode	Standby position (stopped refrigera- tion via r12 or DI input)	-	Modulating thermostat control Emergency cooling due to sensor error	S19 S20	19 20
A59/ Case clean	Case cleaning. Signal from DI input	-	Regulation problem in the injections function	S21	21
A74/ AD fault	Error in the adaptive defrost function	16	Start-up phase 2. Evaporator being charged	S22	22
A75/ AD Iced	Evaporator is iced up. Reduction of air flow	16	Adaptive control	S23	23
A76/ AD not defr.	Defrost of evaporator is not satisfactory	16	Start-up phase 1. Signal reliability from sensors is controlled	S24	24
E1/ Ctrl. error	Faults in the controller	32	Manual control of outputs	S25	25
E6/ RTC error	Check clock		No refrigerant selected	S26	26
		32	Case cleaning	S29	29
E20/ Pe error	Error on pressure transmitter Pe	64	Forced cooling	S30	30
E23/ S1 error	Error on S1 sensor	4	Delay on outputs during start-up	S32	32
E24/ S2 error	Error on S2 sensor	4	Heat function r36 is active	S33	33
E25/ S3 error	Error on S3 sensor	4			
E26/ S4 error	Error on S4 sensor	4	Other displays:		
E27/ S5 error	Error on S5 sensor	4	The defrost temperature cannot be displayed. There is	non	
E28/ S6 error E37/ S5 error B	Error on S6 sensor Error on S5B sensor	4	stop based on time		
		4	Defrost in progress / First cooling after defrost	-d-	
/ Max Def.Time	Defrost stopped based on time instead of, as wanted, on temperature	16	Password required. Set password	PS	

\*) Emergency cooling will take effect when there is lack of signal from a defined S3 or S4 sensor. The regulation will continue with a registered average cutin frequency. There are two registered values – one for day operation and one for night operation.

#### Data communication

The importance of individual alarms can be defined with a setting. The setting must be carried out in the group "Alarm destinations"

Settings from	Settings from	Log		Alarm relay		Send via
System manager	AKM (AKM destination)		Non	High	Low-High	Network
High	1	Х		Х	Х	Х
Middle	2	Х			Х	Х
Low	3	Х			Х	Х
Log only		Х				
Disabled
