Compressor speed

Electronic unit	Resistor (R1) Ω	Motor speed	Contr.circ. current
	(calculated)	rpm	mA
	0	AEO	6
A00	173	2,000	5
INO AFO	450	2,500	4
10 vitto	865	3,000	3
	1696	3,500	2

In AEO (Adaptive Energy Optimizing) speed mode the BD compressor will always adapt its speed to the actual cooling demand.

The electronic unit is intended for solar panels. It can operate within a voltage range from 10 to 45V DC. Max. ambient temperature is 55°C. The electronic unit has a built-in thermal protection which is actuated and stops compressor operation if the electronic unit temperature gets too high.

Installation (Fig. 1)

Connect the terminal plug (9) from the electronic unit to the compressor terminal (10). Mount the electronic unit on the compressor by snapping the cover over the screw head (1).

Power supply (Fig. 1)

The electronic unit must always be connected directly to the solar panel poles (2). Connect the plus to + and the minus to -, otherwise the electronic unit will not work. The electronic unit is protected against reverse battery connection.

For protection of the installation, a fuse (3) must be mounted in the + cable as close to the solar panel as possible. A 15A fuse is recommended.

If a main switch (4) is used, it should be rated to a current of min. 20A.

The "Wire dimensions" in Fig. 2 must be observed.

Thermostat (Fig. 1)

The thermostat (7) is connected between the terminals **C** and **T**. With the thermostat directly connected to terminal **C** the electronic unit will adjust its speed to the actual cooling demand.

Other fixed compressor speeds in the range between 2,000 and 3,500 rpm can be obtained when a resistor (8) is installed to adjust the current (mA) of the control circuit. Resistor values for various motor speeds appear from table *"Compressor speed"* (Fig. 2).

Fan (optional, Fig. 1)

A fan (5) can be connected between the terminals + and **F**. Connect the plus to + and the minus to **F**. Since the output voltage between the terminals + and **F** is equal to the supply voltage. A fan that can handle the voltage range of the solar panel must be chosen.

LED (optional, Fig. 1)

A 10mA light emitting diode (LED) (6) can be connected between the terminals + and \mathbf{D} .

In case the electronic unit records an operational error, the diode will flash a number of times. The number of flashes depends on what kind of operational error was recorded. Each flash will last ¼ second. After the actual number of flashes there will be a delay with no flashes, so that the sequence for each error recording is repeated every 4 seconds.

Number of flashes	Error type
5	Thermal cut-out of electronic unit (If the refrigeration system has been too heavily loaded, or if the ambient temperature is high, the electronic unit will run too hot).
4	Minimum motor speed error (If the refrigeration system is too heavily loaded, the motor cannot maintain minimum speed at approximately 1,850 rpm).
3	Motor start error (The rotor is blocked or the differential pressure in the refrigeration system is too high (>5 bar)).
2	Fan over-current cut-out (The fan loads the electronic unit with more than $1A_{peak}$).
