Electric regulating valves

Type CCMT 2 - CCMT 8 / CCMT 16 - CCMT 42

The CCMT is an electrically operated valve designed specifically for operation in CO₂ systems.

The CCMT valve concept is designed to fulfil global refrigeration requirements.

The valve is capable of functioning either as an expansion valve, as a pressure regulator for the gascooler or as a gas bypass valve with back-pressure regulation in transcritical or subcritical applications.

Features

- Designed for CO₂ systems with maximum working pressure of 140 bar / 2030 psig.
- Applicable to R744 (CO₂) and other common refrigerants. The CCMT is compatible with the oil types PAG, POE and PVE.
- Regulating cone ensures optimum regulating accuracy, particularly at part load.
- Patented cone and balance design.
- The PEEK seat provides excellent valve tightness and robustness.
- Combined butt weld and solder connections.
- Top part with built-in strainer / filter.
- MOPD up to 90 bar / 1305 psi
- CCMT 16 – CCMT 42 is available with or without integrated pressure transmitter.
- Standard M12 connector for simple and flexible connection to the motor driver.
- Low weight and compact design.
- Easy to service. Insert easily taken out by removing top part.
- For manual operation and service of the CCMT an AST-g service driver is available.

For more information on the product, please scan the QR code.

Technical data

Parameter	CCMT 2 – CCMT 8	CCMT 16 - CCMT 42
Compatibility refrigerants	R744 and other refrigerants. Not applicable for flammable refrigerants and Ammonia.	R744 and other refrigerants. Not applicable for flammable refrigerants and Ammonia.
Refrigerant oils	PAG, POE and PVE	PAG, POE and PVE
MOPD	90 bar / 1305 psi	90 bar / 1305 psi
Max. working pressure (PS/MWP)	140 bar / 2030 psig	140 bar / 2030 psig

Accessories:

M12 angle cable

M12 angle female connector is intended for use with a standard M12 male connector, available on stepper motor valves.

This cable is designed to offer high flexibility and small outer diameters with tensile strength. The angle way M12 cable consist of paired, twisted wires, which decreases mutual influence between signals transmitted along the cable and reduces influence of external sources of interference. The cables thus provides a higher degree of protection against lost steps compared to other cables.

CCMT valve

If the controller driving the CCMT valve is from another manufacturer than Danfoss or a custom design, the following points must be considered in order to overcome potential step loss.

To ensure total closing of the valve, and to compensate the lost steps after a defined number of changes in opening degree, the controller should have a function to overdrive the valve in the closing direction. It is recommended to overdrive ten percent of the full steps range at appropriate intervals.

Warning:

At power failure the CCMT valve will remain in the actual opening position it has at the moment of power failure, unless a safety device in the form of a battery backup is installed.

Application

The CCMT valve is developed for transcritical CO₂ applications. The CCMT valve can be used in systems with flash gas bypass, parallel compression as well as in stand-alone applications.

The CCMT valve can be used in transcritical and subcritical conditions.

CCMT valves are typically used as flash gas bypass and high pressure regulation.

Application 1 - High Pressure Valve

The function of the high pressure valve is to control the high pressure in the system according to the reference from the controller. The reference can be set to obtain the optimum COP, optimum capacity or any other factors. Pressure optimization is performed by the CCMT valve, which is installed at the outlet of the gas cooler (see the figure above) and a matching Danfoss controller. This design provides the possibility to optimize gas cooler pressure in all situations and intermediate receiver pressure independently. Please refer to the [www.danfoss.com/CO₂](http://www.danfoss.com/CO2) for more information on CO₂ systems.

transcritical expansion, the pressure can be kept at a safe level for all components situated in the liquid lines of a transcritical CO₂ system. The two phase mixture from the CCMT valve has to be separated before gas enters the gas bypass. For use in the gas bypass application the EKC 326A controller is recommended for CCMT 2 to CCMT 8.

Application 2 - Gas bypass Valve

A gas bypass valve is typically used to regulate the intermediate pressure in a transcritical CO₂ refrigeration system, in order to keep the intermediate pressure low. By venting flash gas generated through a gas bypass valve to the suction side of the compressor after the

Application 3- Expansion Valve

A liquid expansion valve is typically used for injection in plate heat exchangers of CO₂/CO₂ cascades, or as an expansion valve for CO₂ evaporators. For the liquid injection applications CCMT 2 to CCMT 8 is used with EKC 313 controller.

Application 4 - Electric pressure regulator

With CCMT valves, it is possible to obtain an accurate temperature or pressure control by modulating the pressure in the evaporator.

Coolselector®2

is a Danfoss calculation and selection software, designed to make selection processes for all refrigeration projects easier and less time consuming. It is strongly recommended to use Coolselector®2 to find the correct valve for the application.

For fast and precise selection of valve, use Danfoss' CoolSelector2® software. You can download it from <http://coolselector.danfoss.com>
