

AK-CC 550A Prevent High Temp Alarms During Night Shutdown

This guide is to prevent false alarms during a scheduled night shutdown for a salad bar or similar case.

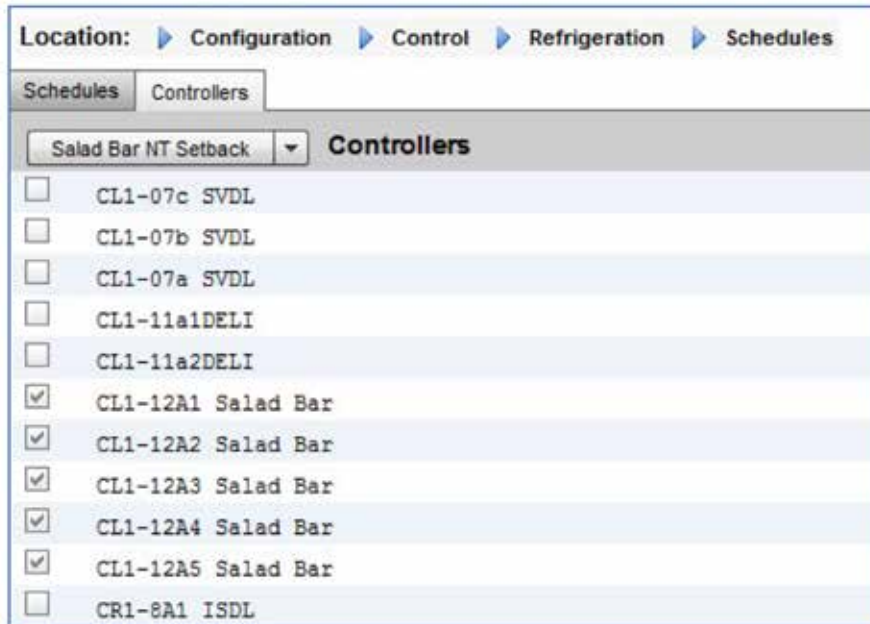

1. Add a new Schedule in Configuration>Control>Refrigeration>Schedules.
Add 1 to the existing number.

2. Set the type to Night Setback and match the hours to your shutdown schedule.

3. On the Controllers tab, add the relevant controllers.

4. Set the Night Offset so the cutout + night offset will be close to room temp. This will increase the alarm setpoint and prevent false alarming during a scheduled nightly case shutdown.
