This product information is a part of the documentation for the Danfoss scope of delivery and serves as product presentation and customer advisory service. It contains important information and technical data regarding the product.

This product information should be supplemented with the information about the industrial safety and health related regulations at the site of installation of the product. The regulations vary from place to place as a result of the statutory regulations applicable at the site of installation and are therefore not considered in this product information.

In addition to this product information and the accident prevention regulations applicable for the respective country and area where the product is used, the technical regulations for safe and professional work must also be observed.

This product information has been written in good faith. However, Danfoss cannot be held responsible for any errors that this document may contain or for their consequences.

Danfoss reserves the right to make technical changes during the course of further development of the equipment covered by this product information.

Illustrations and drawings in this product information are simplified representations. As a result of the improvements and changes, it is possible that the illustrations do not exactly match the current development status. The technical data and dimensions are subject to change. No claims will be accepted on the basis of them.

EU DECLARATION OF CONFORMITY
Danfoss A/S
Refrigeration & Air Conditioning Controls

declares under our sole responsibility that the
Product category: Intelligent Purger System (Air Purger)
Type designation(s): IPS 8, code numbers 084H5004, 084H5005
Covered by this declaration is in conformity with the following directive(s), standard(s) or other normative document(s), provided that the product is used in accordance with our instructions.

Machine Directive 2006/42/EC
EN 378-2:2016 Refrigerating systems and heat pumps - Safety and environmental requirements - Part 2: Design, construction, testing, marking and documentation

EN 60204-1:2018 Safety requirements for electrical equipment for measurement, control, and laboratory use – Part 1: General requirements

Pressure Equipment Directive 2014/68/EU (PED)
EN 378-2:2016 Refrigerating systems and heat pumps - Safety and environmental requirements - Part 2: Design, construction, testing, marking and documentation

Ammonia side (R717): Category A4P3. Fluid group: 1. PS = 40 bar. TS: -40 °C to 60 °C.
R290 side: Category I. Fluid group: 1. PS = 24 bar. TS: -40 °C to 60 °C

Ambient temperature: -10 °C to 43 °C

Electromagnetic Compatibility Directive 2014/30/EU (EMC)
EN 61000-6-2:2005 Electromagnetic compatibility (EMC) - Part 6-2: Generic standards – Immunity standard for industrial environments (IEC77/488/CDV:2015)

EN 61000-6-4:2007/A1:2011 Electromagnetic compatibility (EMC) - Part 6-4: Generic standards – Emission standard for industrial environments

Note: EMC test performed with cable length < 30 m.

Introduction

The Danfoss Intelligent Purging System (IPS 8) is a stand-alone, self-contained purging unit designed to remove non-condensable gases (NC gases = air and other unwanted foreign gases) from industrial ammonia refrigeration systems.

The IPS control can handle up to 8 purge points automatically.

The ingress of NC gases into a refrigeration system is inevitable, regardless of the refrigerant, pressures, or temperatures. NC gases in the system will result in a decrease in system efficiency, both in terms of an increase in power consumption and reduced cooling capacity.

Due to having a different density than ammonia, the ingressed air will accumulate in specific areas of the system, where it can be removed using the Danfoss IPS 8.
The accumulation areas are identified in the Connection locations section, along with recommended connection principles.

The purger unit is an electronically controlled, self-contained R290 refrigerant system that runs independent of the main ammonia system and with only one flange connection to the ammonia plant.

The flanged opening allows the ammonia gas/NC gas mix access to the purger's heat exchanger, where it is split into ammonia condensate and NC gases. The ammonia condensate is returned by gravity to the main plant, while the NC gases are purged to the atmosphere through e.g. a water bath.

Through the flanged opening, the purger unit has access to the parameters from the ammonia plant required for full electronic control.

The unit runs automatically in 24-hour cycles, checking for the presence of NC gases and, if present, removes the NC gases.

To regain and retain the design capacity of the main ammonia system and prevent future air accumulation, it is highly recommended to install the Danfoss IPS 8.

Features

- State-of-the-art electronically controlled unit based on the Danfoss MCX controller platform
- Reduced power consumption of the ammonia plant
- Automatic purging response to NC gases in the refrigeration system
- Continuous and smart monitoring of differential pressure between the system refrigerant and the purger's refrigerant
- Smart purging that minimizes refrigerant (ammonia) release to the environment
- Self-contained unit operation, which functions independently from the main plant
- An operation log for easy purging cycle data monitoring
- Industry standard Modbus RTU communication for remote monitoring and system integration
- Reduced purging unit power consumption compared to other units due to on-demand operation only

- Load scheme to identify which purge point is removing most NCC
- Prepared to manage/control Bubbler
- Option to install LLS 4000 to protect IPS for high column of ammonia liquid
- Self-diagnostics for both unit and system operation to shut down in the event of malfunctions
- Cost-effective installation with few mechanical and electrical connections
- A fully brazed and leak-tested R290 cooling system, minimizing leakage risks
- A plug-and-play stand-alone design, which simplifies installation and commissioning while reducing potential errors
- No need for advanced settings
- A compact and easy-to-handle design
- IPS carry a registered patent
- With our solution of IPS 8 Air Purger combined with the Bubbler, we can help customers to keep machine rooms free of ammonia smelling, while IPS 8 is removing the non-condensable gases, and purging to the Bubbler
- IPS 8 supports another 8 Purge points can be added, giving in total 16 Purge points

Working principle

The Danfoss IPS 8 is factory-tested and ready to use in ammonia plants with a condenser pressure of more than 6,5 bar (94 psi). The purger is charged with below 150 gram (5.3 oz) of R290.

Only 1 mechanical connection is needed for the purger (see fig. 1). The flow of ammonia/NC gases from the main plant is done through the flange for ammonia (see 13 in Fig. 1 below), while the NC gas purge is done through the blow-off pipe after the purge restrictor (18).

Through the flange for ammonia (13), a mixture of ammonia gas and NC gases enters the heat exchanger (12) part of the purger.

The ammonia gas/NC gas mix is cooled down below the condensing temperature of the ammonia by the R290 circuit. At this point, ammonia gas condenses and returns by gravity to the ammonia plant whereas the NC gases accumulate in the heat exchanger (12) for subsequent purging.

By condensing the ammonia gas, a new ammonia/NC gases mix is naturally pulled through. This new mix is separated through a continuous process.

As the NC gas concentration in the heat exchanger (12) increases, the R290 heat exchanger pressure and temperature will simultaneously decrease.

The controller continuously monitors the R290 heat exchanger pressure as well as ammonia pressure and temperature. When the R290 pressure reaches a predefined pressure difference when compared with the ammonia pressure (temperature) it prepares to purge the NC gases through the solenoid valve (16). The blow-off is activated by the solenoid (16) and through appropriate piping/hosing, should be led into a water bath. This process is recommended to retain small amounts of ammonia (see Installation section).

Working cycle

The Danfoss IPS 8 operates in 24-hour cycles, of which 45 minutes are dedicated to an R290 pull down. At power on, the pull down is initiated immediately. If no NC gases are detected during the 40 minute pull down, the system will close the solenoid valve at purge point 1 and open the solenoid valve at point 2. After a cycle time of 24 hours/N (Number of purge points), the compressor will pull down again condensing the ammonia. After 24 hours, all purge points have been vented one time.

To identify NC gases, the controller utilizes upper and lower thresholds for R290 evaporating temperature. If, during pull down, the temperature continues decreasing and the lower threshold is passed, the controller considers this to be a high concentration of NC gases and opens the purge solenoid valve. The purge valve will stay open until sufficient condensing ammonia is present to lift the R290 evaporating temperature above the upper threshold.

The compressor will continue running and if the temperature again decreases below the lower threshold, a new purge will be performed. This process will be repeated until the R290 heat exchanger temperature stays above the lower threshold for >40 minutes following the previous closure of the purge valve.

Label ID	Parameter Name	Description and selection options	Factory setting
CM3	PDT	Pull down time Pull down time of compressor	40 min
CM4	CST	Compressor start time See Fig. 2 for details	1440 min (24 h)
VA5	PLT	Endless purging max time Max time for endless purging on one point. When the time has expired, IPS will go to next Purge Point (PP)	24 h

See complete Parameter List – Table 01

If "Psat717" is increasing. (here from 6.9 Bar to 7.7) The difference between "VClseT" and "VOpenT", of 5^{0}K remains, but the 5^{0}K window moves downwards.
(If "Psat717" is decreasing. The difference between "VClseT" and "VOpenT", of 5^{0}K remains, but the 5^{0}K window, moves upwards.

Fig. 3a

Air traps

Fig. 4 Liquid level. Bottom connected receiver

*Fig. 5 Liquid level. Top connected receiver*

For systems with low pressure liquid level control, the correct condenser/ receiver installation is as shown in Fig. 4 and Fig. 5.

The discharge gas from the compressor (1) is led to the condenser (2) where it is condensed. The receiver (3) holds the liquid until there is a demand for liquid from the LP side, e.g., until the expansion valve (4) opens. If the expansion valve is closed, the liquid condensed in the condenser will need to be stored in the receiver and the level will increase. To ensure a free flow to the receiver, the gas must be allowed to leave the receiver; this process is accomplished through the pressure equalizing line (a). The pressure equalizing line makes the pressure in the receiver the same as in the compressor discharge line. The pressure in the condenser outlet is lower due to the pressure loss in the condenser. Since the condenser outlet pressure is lower than in the receiver, it is therefore necessary to mount the condenser higher than the receiver and allow for a higher liquid level in the piping between the condenser and the receiver (b).
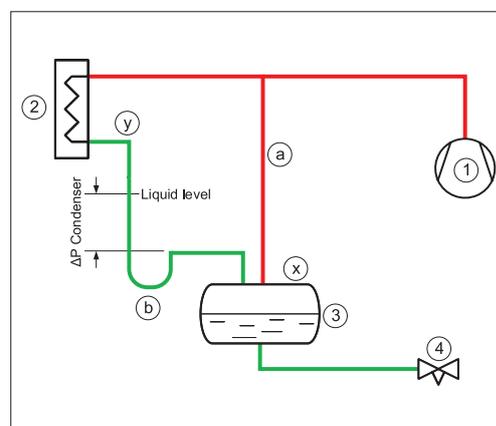

The liquid column in the line (b) compensates for the pressure difference between the condenser outlet and the receiver.

Fig. 4 shows the liquid connection at the bottom of the receiver.

If the liquid from the condenser is connected to the top of the receiver (Fig. 5), a slightly different arrangement must be made.
The liquid line (b) from the condenser to the receiver will need to have a goose neck/liquid trap to ensure that the liquid column is actually established.

As air is heavier than ammonia gas, the air will collect in two locations in this type of installation: On top of the liquid in the receiver (x) and/or on top of the liquid in the drop leg from the condenser (y).

Connection locations

Air purger installation in a <u>low-pressure</u> liquid level controlled installation

The correct locations for the air purger to be connected to the ammonia plant are:
(See Fig. 6 and Fig. 7)

- on top of the receiver or
- on top of the liquid in the drop leg from the condenser.

The air purger (5) is connected to the two purge points through solenoid valves (px and py). Note that only one solenoid should be open at any given time, otherwise the liquid column in

the condenser will be short-circuited.
The air purger must have its own liquid return drop leg (c) connected in parallel with the condenser's drop legs (b).

When the purger is connected to the receiver i.e. solenoid (px) open, the liquid level in the air purgers drop leg (c) will be equal to the receiver liquid level (3); when the purger is connected to the condenser outlet i.e. solenoid (py) open, the liquid level will be equal to the liquid level in the condenser drop leg (b).

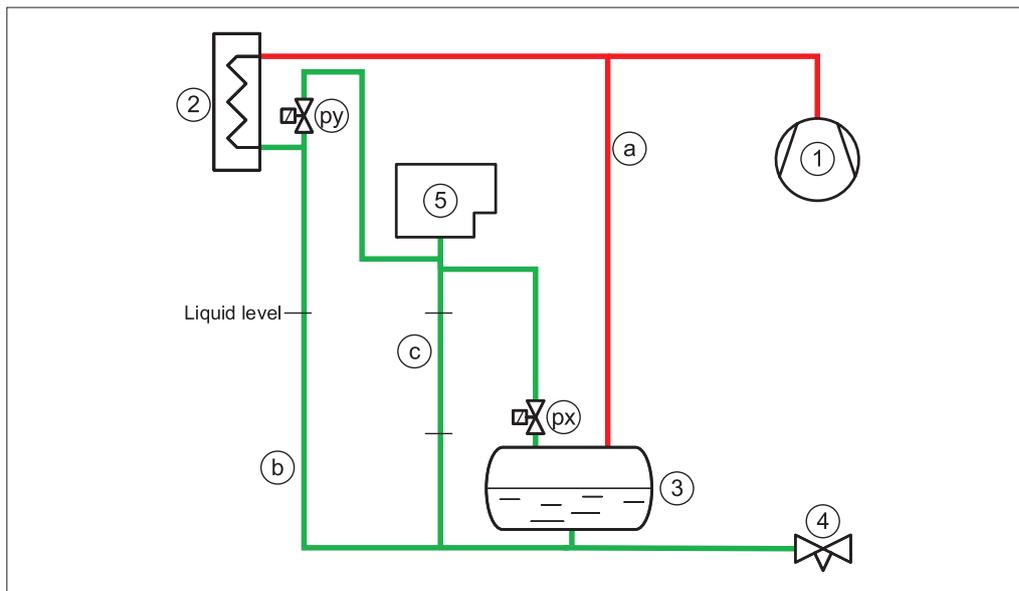

Fig. 6 Purger connections (px) & (py). Drain piping (c) must be vertical/downward slope

Alternatively, the air purger draining of liquid can be achieved effectively through an HP float valve (6) to the low pressure side (see Fig. 7).

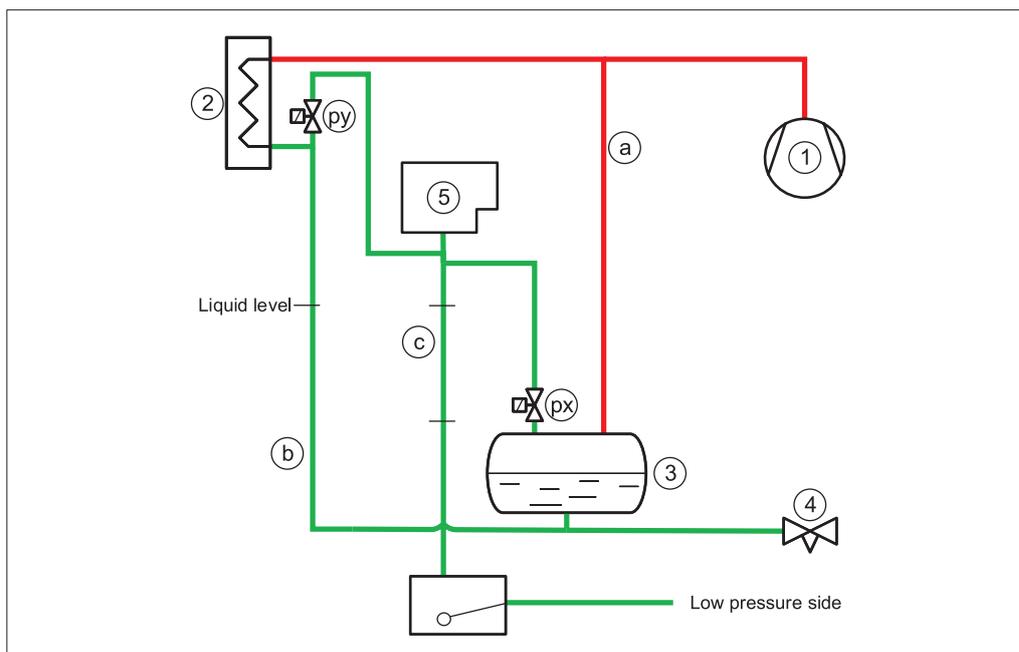

Fig. 7 Purger connections (px) & (py). Drain piping (c) must be vertical/downward slope

Connection locations
(continued)

Air purger installation in a <u>high-pressure</u> liquid level controlled installation

For systems with a high-pressure liquid level control, the air will collect in the float valve (3). (See Fig. 8).

The compressor (1) supplies high-pressure gas to the condenser (2), where it is condensed. The float valve (3) will flash any liquid back to the LP side. The air purger (5) must be connected to the float valve through a solenoid valve (pv).
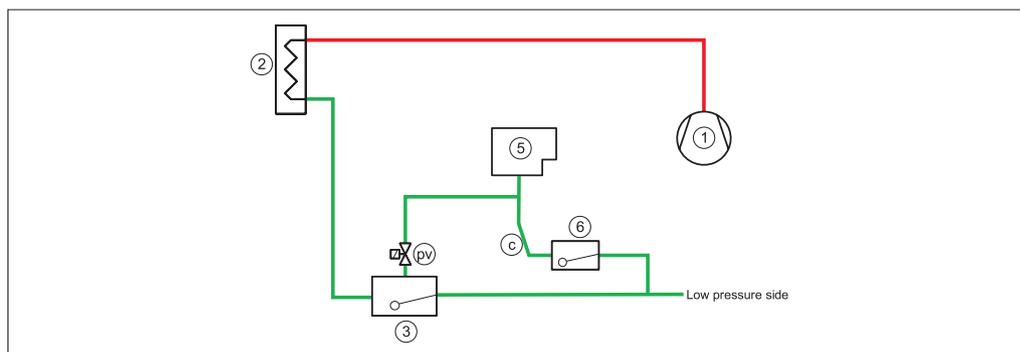

The ammonia liquid condensed in the air purger must be drained through drain pipe (c) to the LP side via a float valve (6).

Fig. 8 Purger connections (pv). Drain Piping (c) must be vertical/downward slope

General

The air purger must always be mounted above the highest liquid level to be able to drain the ammonia condensed in it. Otherwise, the air purger can flood and potentially purge ammonia liquid.

The purger liquid return leg (c) <u>must</u> always be mounted vertically or at minimum, with a downward slope.

The solenoid valves at the connection points must never be activated at the same time. Finalize purging at one location before switching to the next.

⚠ **WARNING !** Cod. 99000572

Follow the installation guide strictly during Purger installation. Install the Purger unit in a location where the bottom flange level and any gas inlet connection level is above any possible ammonia liquid level.

Liquid drain piping from the purger must always have a downward slope.

Install a shut off valve close to the bottom flange entrance to enable removal of the unit and closing for high pressure ammonia gas.

Connect proper resistant piping to the purging outlet pipe and ensure the purged non-condensables are discharged into a water bath of max. 200 liter.

Connection points

Multi-point purging

As factory default, the Danfoss IPS 8 is configured to manage up to 8 purge points. (Multi-point purging. See Fig. 10).
The actual amount of purge points connected needs to be setup in the MCX controller after power-up.
The parameter in question for entering the actual number of purge point: V10, Max_PP (See Table 3).

Single point purging setup is possible (See Fig. 09 -no purge solenoid valves).
For single point purging the parameter in question for entering the actual number of purge point: V10, Max_PP must be set to 1 (See Table 3).

Both power and control wiring of the installed solenoid valves coils should take place prior to first power up.

NEVER HAVE MORE THAN 1 PURGE POINT OPEN AT A TIME.
Always close one purge valve before opening the next.

This is done by turning the purger unit power on and entering the number of actual purge points (V10, Max_PP) in the program. See section "Programming/configuration".

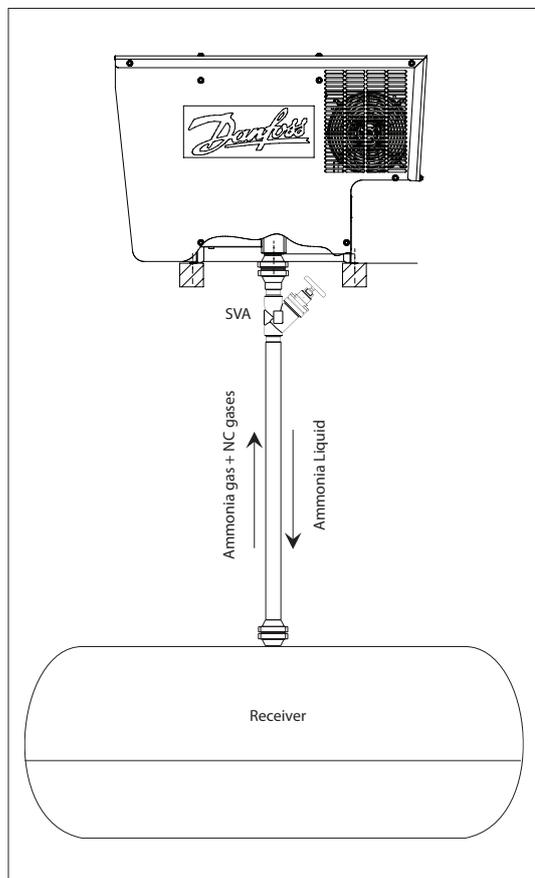

*Fig. 9 Single point purging from receiver*

Fig. 10 Multi-point purging from up to 8 purging points

Installation

The Danfoss IPS 8 must be installed in accordance with locations recommended in the Connection locations and Connection points sections of this document.

The unit has a protection rating of IP55 and may be installed outside, in ambient temperature ranges from from -10 °C to 43 °C / 14 °F to 109 °F). Avoid installation in direct sunlight as this may lead to excessive sunlight exposure and ambient temperatures above allowed limits. For ambient temperatures below -10 °C (14 °F) the air purger must be installed in a heated and ventilated area. The unit must be installed in a non-ATEX atmosphere as the purger unit is not explosion proof.

The purger unit should be kept in an upright position at all times - from receipt to final installation.

Use all 4 lifting eyes and suitable lifting gear during installation (unit weight = 100 kg/220 lbs).

Install the unit on an even horizontal base 0.05 to 1.1 meter (2 to 43 in) above a service platform with sufficient support and allowing the purger subframe to be bolted to the support (see example in Fig. 12). Maintain recommended distances in all directions (Fig. 12) to allow fan cooling and servicing.
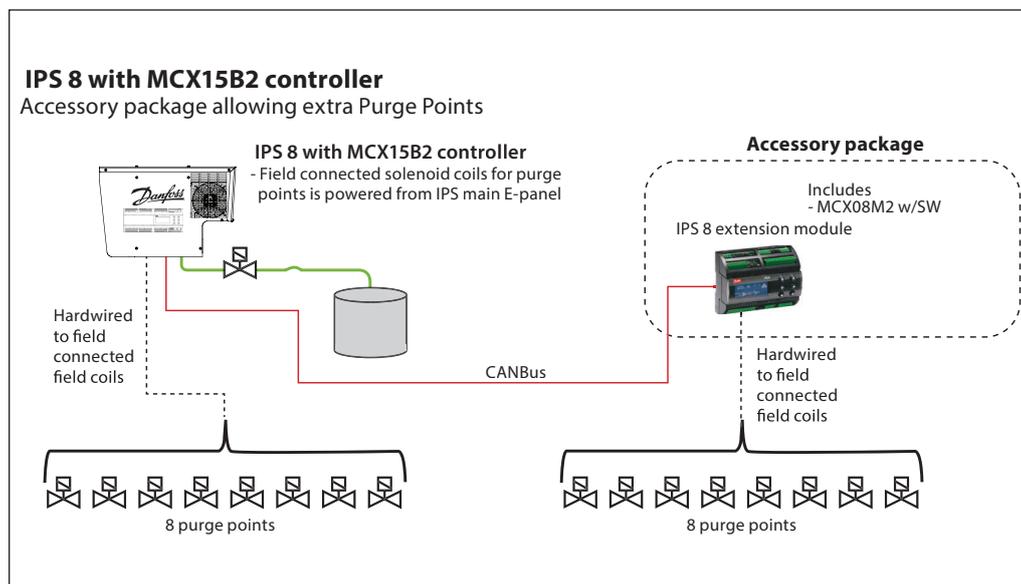

☞ Always leave the unit off for at least 12 hours from finished installation to first time power up.

It is important that the support construction is level to ensure the internal liquid trap is properly filled. **Angle to horizontal < 2 degrees**

Lifting Procedure

☞ **All 4 lifting eyes must be positioned correctly, to match the actual used lifting gear**
All 4 lifting eyes must be used

Installation *(continued)*

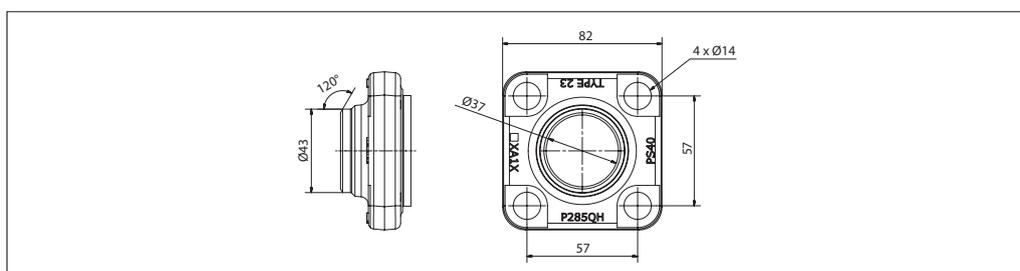

Fig. 13 Ammonia connection

Fig. 14 Enclosed weld flange

1. Prepare the ammonia pipework with the weld flange according to Fig. 13 and Fig. 14. The main/drain piping should never be smaller than inner diameter Ø37 mm (1.5 in).

2. Complete the supporting structure able to carry 100 kg (221 lbs).

3. Lift the purger into position using the lifting eyes on each side of the purger's cabinet. **Remove the rubber plug from the flange opening. See Fig. 13.**

4. Connect the weld flange with the purger flange using the enclosed flat gasket and tighten the supplied 4 bolts diagonally to a torque of 60 Nm (44.3 ft-lb).

5. Insert 4 bolts (not supplied) through the purger frame and the support construction and tighten.

6. Perform a leak test to ensure an airtight connection.

7. In the event the purger unit needs to be dismantled please contact Danfoss for instructions.

8. Correctly install a suitable pipe/hose from the purge solenoid valve for blow-off of NC gases in accordance with local or national regulations.

9. Prepare an outside water tank with a maximum of 200 liters (53 gal.) and ensure the piping allows the purged gas to be immersed in the water.

10. Regularly check the pH level of the tank's contents.

11. The pH level should never exceed 12.6. Otherwise the water content must be renewed.

12. Dispose of concentrated waste water in accordance with to local/national regulations.

Note: Prior to replacing the water in the water tank ensure that the purger is switched off and the shut off valve at the flanged purger inlet is closed. Leave the unit in this condition for a period to allow the remaining gas in the piping to be dissolved/released.
Watch out for bubbles.

Establish a procedure for regular checking the pH level and bubble pattern. If continuous bubbles are observed in the water tank during "stand by" (Green light indicator) in normal operation, one or more of the purge solenoid valves needs repair or replacement.

Electrical wiring

The internal wiring of the purger is done at the factory. Only the electrical wiring for the main power supply, the purge point solenoids and optional bus communication needs wiring on site.

It is highly recommended that all external cables coming from the IPS 8 to the power supply and to all purge point solenoids are protected by metallic pipes.

Fig. 15 Controller box external

Controller box cover can only be opened at key unlock and with the main switch off.
Note: Authorized personel only

Light Indicators
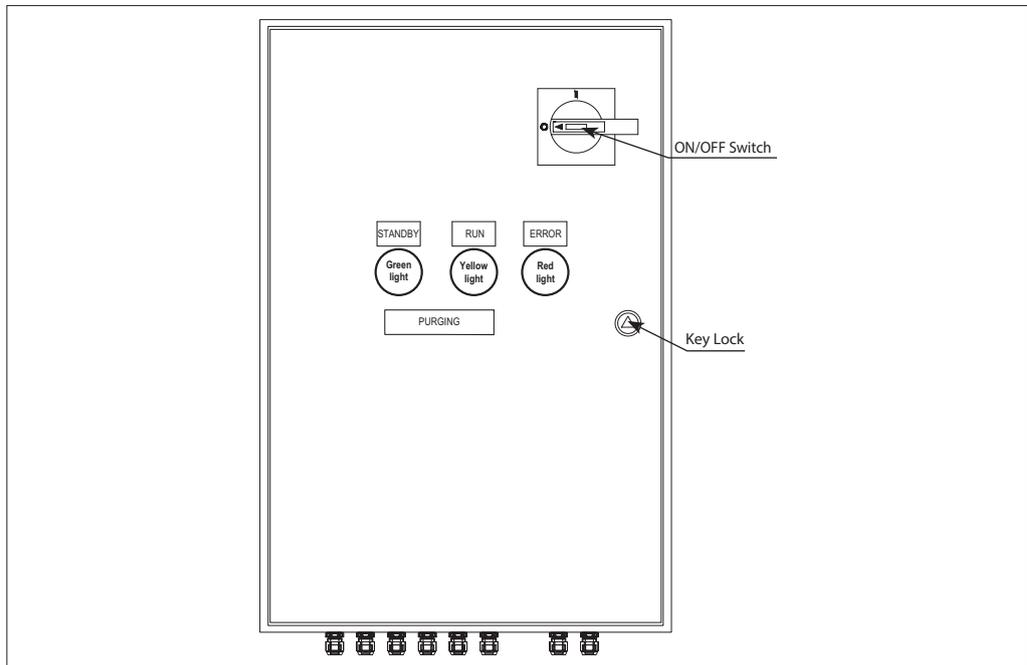

Fig. 20

Lights ON	Status	Compressor ON	Compressor OFF	Purge Valve ON	Purge Valve OFF	Alarm
Green	Stand by		x		x	
Yellow	Run	x			x	
Green & Yellow	Purging	x		x		
Green & Yellow & Red	Uninterupted Long time purging (> 150 h)	x		x*		
Red	Occurs when: Check list of alarms description	(x**)	x**			x

* The purger continuous purging until max running period (default 160 h) is reached and the purger compressor will stop
** The purger compressor stops when alarm occurs

Quick Startup

For the fastest possible system configuration after connecting all purge points to the IPS and following first power up of the IPS, follow these simple instructions:
1. Navigate from the Main Menu to Login
2. Enter password '200'.
3. Choose 'Parameters'.
4. Choose 'Unit Config'
5. Choose 'Valve Settings'
6. Enter the amount of purge solenoid valves connected to the IPS.

Navigation - built in MCX controller
(Placed at the rear of the front panel door)

After switching on the controller, a display window will momentarily show the actual software version, followed by the default main operating window shown in Fig. 26.

While in operation mode, the Up/Down arrow buttons lead the user to the status windows described in Table 01 below.

Fig. 21 - Default main window. Operating (start) mode. (Examples only)

Bubbler functionality. See Fig. 22

Fig. 21a

Fig. 22

Configuring IPS via the HMI[1)]
on the MCX15B2 controller   By pressing ⏎ the main menu will show up with the options below

Table 01
Main menu navigation

| Label ID	Parameter Name	Description and selection options	Min.	Max.	Value/ Type	Unit	RW	MODBUS Register
StU		General > Setup						
y01	**Main switch**	**Release the IPS for operation** OFF: the IPS is forced out of operation ON: the controller released for operation. Observe if DI1, On/ Off - External Mainswitch must also be ON to release the IPS for operation	0	1	0 - OFF	Enum 1	RW	3001
y07	**Restore default parameters**	**Back factory settings** No: Not active Yes: All parameters will be returned to factory default settings, and the alarm list will be cleared. The parameter will automatically be set back to 'No' when factory reset has finished (after a few seconds).	0	1	0 - NO	Enum 2	RW	3002
SEr		General > Serial settings						
SEr	**Serial address (Modbus and CAN)**	**Enter ID adress of the controller** Only relevant if connected to external equipment (like PLC) or other Danfoss equipment.	1	100	1		RW	3006
bAU	**Serial baudrate (Modbus)**	**Baudrate** The system unit usually communicates with 38.400. 0=0 1=12 corresponds to 1200 2=24 corresponds to 2400 3=48 corresponds to 4800 4=96 corresponds to 9600 5=144 corresponds to 14400 6=192 corresponds to 192000 7=288 corresponds to 288000 8=384 corresponds to 38400	0	8	8 - 384	Enum 3	RW	3007
COM	**Serial settings (Modbus)**	**Serial mode** 0=8N1 1=8E1 2=8N2	0	2	1 - 8E1	Enum 4	RW	3008
ExP		General > Expansion settings						
Ex1	**Enable expansion**	**Enable expansion of extra purge point** Panel with MCX contoller to purge extra purge points, in addition to the 8 purge points at the main IPS No: Disabel Yes: Enable	0	1	0 - NO	Enum 2	RW	3013
Ex2	**Expansion address**	**Expansion adress of MCX controller** Located in external panel (outside main IPS electrical panel)	0	255	125		RW	3014
CMP		Unit config > Compressor						
CM3	**PDT**	**Pull down time** Pull down time of compressor	1	CM4	40	min	RW	3016
CM4	**CST**	**Compressor start time** See Fig. 2 for details	180	2000	1440	min	RW	3017
VA5	**PLT**	**Endless purging max time** Max time for endless purging on one point. When the time has expired, IPS will go to next Purge Point (PP)	2	768	24	h	RW	3018
VAL		Unit config > Valve settings						
VA2	**DeltaTValveOFF**	**Temperatue difference Open/Close Main Purge valve** Temperature diffrence between opening and and closing setpoint of main Purge valve on DO2	2.0	10.0	5.0		RW	3019
V10	**Max_PP**	**Max number of Purge points** Enter number of purge point (valves) connected to IPS	1	16	8		RW	3026
BUB		Unit config > Bubbler settings						
BU6	**On/Off Bubbler**	**Bubbler connected?** Select if a bubbler is connected and water valve (on DO15)will be controlled OFF: Function disabled ON: Function enabled	0	1	0 - OFF	Enum 1	RW	3032
BU1	**Bubbler time**	**Bubbler time** Time for water valve to open for adding water to bubbler after start of compressor	0	720	30	s	RW	3033
BU2	**Bubbler manual off time**	**Bubbler manual off time** Only active if BU3, Bubbler man start=ON Se description for BU3, Bubbler man start	0	100	1	min	RW	3034
BU3	**Bubbler man start**	**Manual opening of water valve for bubbler** Select manual opening of water valve - DO15 OFF: Function disabled ON: Function enabled. Water valve will be open for the time ,given by BU3, Bubbler man start, have expired and close again	0	1	0 - OFF	Enum 1	RW	3035

[1)] Human Machine Interface (HMI) is the interface between the IPS and the user. Here the key pad and the display on the MCX15B2

Label ID	Parameter Name	Description and selection options	Min.	Max.	Value/ Type	Unit	RW	MODBUS Register
BU4	Clean period	**Bubbler cleaning program** Setting of time between start cleaning of bubbler. Se description for BU5, Clean duration	0	72	24	h	RW	3036
BU5	Clean duration	**Bubbler cleaning program - duration** Once the Cleaning start period, given by BU4, Clean period, has has passed, the water valve - DO15 will open until the time give by BU5, Clean duration has expired	0	100	5	min	RW	3037
BU7	Water stop delay	**Water stop delay** Delay for closing water valve - DO15 after main purge valve - DO2 is closed	0	360	30	sec	RW	3038
LIM		Unit config > Limits settings						
LI3	BPLMin	**Calibration Low Pressure tranmitter R290. [bar]** Minimum value	-1.0	25.0	0.1	bar	RW	3051

Table 02
Occurring active alarms, possible reasons and recommended action

Label	Parameter Name	Description	Possible Reason	Recommended action
			ALARMS	
A01	General alarm	Input from AI3 Leads to shut down of IPS 8	Fault in system connected to the DIO4	Input from AI3 Leads to shut down of IPS 9
E01	Temp Sensor Fault	Indicates no signal from temperature sensor (R290)	Broken wire to R290 temperature sensor	Repair temperature sensor wire or replace temperature sensor
E01	Temp Sensor Fault	Indicates no signal from temperature sensor (R290)	Electrical supply failure supplying R290 temperature sensor	Repair or replace power source
E01	Temp Sensor Fault	Indicates no signal from temperature sensor (R290)	Temperature measurement of the R290 line is out of range	Compare temperature with another temperature sensor reading and replace temperature sensor if needed
E02	BPL Sensor Fault	Indicates no signal from pressure transmitter (R290)	Broken wire to R290 pressure transmitter	Repair pressure transmitter wire or replace pressure transmitter
E02	BPL Sensor Fault	Indicates no signal from pressure transmitter (R290)	Electrical supply failure to the R290 pressure transmitter	Repair or replace power source
E02	BPL Sensor Fault	Indicates no signal from pressure transmitter (R290)	Pressure measurement of the R290 line is out of range	Compare pressure with another pressure reading and replace pressure transmitter if needed
E03	BPH Sensor Fault	Indicates no signal from pressure transmitter (R717)	Broken wire to R717 pressure transmitter	Repair pressure transmitter wire or replace pressure transmitter
E03	BPH Sensor Fault	Indicates no signal from pressure transmitter (R717)	Electrical supply failure to the R717 pressure transmitter	Repair or replace power source
E03	BPH Sensor Fault	Indicates no signal from pressure transmitter (R717)	Pressure measurement of the R717 line is out of range	Compare pressure with another pressure reading and replace pressure transmitter if needed
E04	Low temperature	Indicates too low ambient temperature (<-10 ℃)	Too low ambient temperature	Move the IPS to a higher ambient temperature
E05	High temperature	Indicates too high ambient temperature (>120 ℃)	Too high ambient temperature	Move the IPS to a lower ambient temperature
E05	High temperature	Low R290 charge because of possible leak	Locate and repair leak	Move the IPS to a lower ambient temperature
E06	Low pressure BPL	Indicates too low R290 pressure	Choked restrictor / wrong piping	Factory setting 0.3 bar, we can have several problems: a) Restrictor is blocked (clean it). b) Wrong piping and as addition ammonia is draining, so check piping's. c) Check SV float
E07	High pressure BPL	Indicates too high R290 pressure	R290 system pressure too high	a) Expansion valve is not working b) To high ambient temperature (24 bar /54 ℃)
E08	Low pressure BPH	Indicates too low R717 pressure	Closed stop valve	Purge points are blocked, or flange is blocked with rubber plug
E09	High pressure BPH	Indicates too high R717 pressure	R717 system pressure too high	Pressure is 24 bar
E10	System is OFF	Indicates status of the main switch	Main switch is OFF	Switch ON the main switch
E11	Memory is full	A memory reset is required	Memory is full from long time operation	Clean MCX memory by means of finding Parameters_UnitConfig_
E12	Totla purge time error	This occurs when PLT is activated System will automatically restart when CST has expired	Restrictor is blocked	Replace the restrictor
E13	Compressor ERROR	Indicates no status is being received from relay KL01	Possible broken wire from the MCX	Repair broken wire from the MCX
E14	Liquid alarm	Signal from the LLS that there is liquid in the evaporator	Check piping	
E15	Memory wrong!	Wrong counter values	Carry out: **Reset** to factory setting	
E16	Discharge sensor error	Indicates no signal from temperature sensor	Check sensor	
E17	Suction sensor error	Indicates no signal from temperature sensor	Check sensor	

All alarms except (*) activates red light on box outside
For alarms not resettable and/or cause not identified, please contact Danfoss
Level legend: 0 = Read view, 2 = Installer view (code 200) 3 = Danfoss Service view (Contact Danfoss)

Modbus RTU

Good Practice

The wiring of Modbus RTU (RS485) must be carried out in accordance with the standard ANSI/TIA/EIA-485-A-1998.

Galvanic separation shall be provided for segments crossing buildings.

Common ground shall be used for all devices on the same network inclusive router, gateways etc.

All bus connections in the cables are made with twisted pair wires.

The recommended cable type for this is AWG 22/0.32 mm^2. If used for longer distances please use a AWG 20/0.5mm^2 or AWG 18/0.75mm^2 cable. The cables characteristic impedance shall be between 100 – 130Ω The capacitance between conductors shall be less than 100 pf per meter.

Note: the length of the cables influence the communication speed used. Longer cable lengths mean lower baud rate should be used. Maximum cable length allowed is 1200m.
Use a minimum 20 cm distance between 110V/230V/400V power line cables and bus cables.

Maintenance/Service/ Disposal

Table 03
Maintenance checklist - Perform once a year minimum

1	Use P&I dagram and check that all powered components are working properly
2	Check for alarms in the MCX controller
3	Fans, air filters and fins must be cleaned for dirt and dust
4	Expansion valve must be inspected and must be replaced if damaged
5	Ensure expansion valves sensor bulb has good contact with suction line
6	Replace water in water bubble bath. Check pH level frequently and replace when pH > 12.6
7	Check cover is mounted correctly and all bolts are tightened accordingly
8	Check and verify the amperage of the unit
9	Check for abnormal compressor noises in normal operating conditions (may indicate loose bolts, worn bearings or pistons)

Table 04
Procedure to isolate IPS for servicing

	Multipoint	Single point purging from receiver
1	Close all supply lines from the purge points of the ammonia system. Do not close any stop valve between IPS 8 and float valve	Restart the controller to force pump-down
2	Restart the controller to force pump-down	Wait 20 minutes
3	Wait 20 minutes	
4	Stop the compressor by turning the compressor switch QM1 to the off position	Stop the compressor by turning the compressor switch QM1 to the off position
5	Close the SVA shut-off valve in the drain line (located under the IPS 8)	Close the SVA shut-off valve in the drain line (located under the IPS 8)
6	Release the remaining system pressure to atmosphere by opening the SNV drain valve. This can also be done by attaching a permanent magnet on the AKVA 10 valve for forced opening	Release the remaining system pressure to atmosphere by opening the SNV drain valve. This can also be done by attaching a permanent magnet on the AKVA 10 valve for forced opening

Disposal of the IPS 8
If an IPS 8 unit is worn out and has to be replaced, the disposal must be done in accordance with national legislation and only done by competent personnel.
