Data Sheet

Thermostatic Sensor RAS-C\(^2\) with RA-FN Radiator Valve (Fixed Capacity)

Application

The RAS-C\(^2\) thermostatic sensor is a self-actuating proportional controller with a small P-band.

RAS-C\(^2\) has a temperature range from 8 to 28° C and is equipped with frost protection setting and positive shut-off for maximum user flexibility.

The RAS-C\(^2\) thermostatic sensor and the RA-FN valves are designed for use in 2-pipe domestic heating systems.

The valves are manufactured from brass with nickel plating.

The pressure pin of the gland seal is of chromium steel and works in a lifetime lubricated O-ring seal. The complete gland assembly can be replaced without draining down the system.

The valves are supplied with a grey protective cap, which can be used for manual regulation during the construction phase. The protective cap must not be used as a manual shut off device. A special manual shut off device (code no. 013G5002) should be used.

Compression fittings for 14 mm, 12 mm or 10 mm copper tube are available.

In order to avoid deposition and corrosion, the composition of the hot water must be in accordance with the VDI 2035 guideline (Verein Deutscher Ingenieure).

It is recommended that formulations containing mineral oil are avoided.

Approved to EN 215

Thermostatic sensors RAS-C\(^2\) with RA-FN radiator valves (fixed capacity) are manufactured to the highest standards, and are approved to the European standard EN 215.

Technical data

Max. working pressure: 10 bar, max. diff.2) pressure: 0.6 bar, test pressure: 16 bar

1) The kv-value indicates the water flow (Q) in m³/h at a pressure drop (Δp) across the valve of 1 bar;
   \[ k_v = \frac{Q}{\sqrt{\Delta p}} \]
   At setting N the kv-value is stated according to EN 215, at XP = 2K i.e. the valve is closed at 2°C higher room temperature. At lower settings the XP value is reduced to 0.5K of the setting value 1. The kvs-value states the flow Q at a maximum lift, i.e. at fully open valve at setting N.

2) Working pressure = static + differential pressure. The maximum differential pressure specified is the maximum pressure at which the valves give satisfactory regulation. As with any device which imposes a pressure drop in the system, noise may occur under certain flow/pressure conditions. To ensure quiet operation, maximum pressure drop should not exceed 30 to 35 kPa. The differential pressure can be reduced by the use of the Danfoss differential pressure regulators types AVC, AVDL, AVDS, IVD or ASV-P.

All accessories comes in boxes of 10 pcs.

Mounting

1. Remove the valve protection cap.
2. Turn the sensor to , then turn the union nut as much as possible to the right.
3. Mount the sensor with the scale pointer upwards.
4. Press the sensor firmly onto the valve.
5. Secure connection by turning the union nut clock-wise by hand.
6. Fully tighten the grey union nut using a pair of parrot nose pliers.
