Neutral positioning test............................................................. 38
Cut off valve test........................................................................ 38
RSV valve test.......................................................................... 38

Check for external leakage

Shock valves

Tightening torques for connections
Safety precautions

⚠️ Warning

Unintended vehicle or machine movement hazard.
Unintended movement of the machine or mechanism may cause injury to the technician or bystanders. To prevent unintended movement, secure the machine or disable/disconnect the mechanism while servicing.

⚠️ Warning

Flammable cleaning solvents
Some cleaning solvents are flammable. To eliminate the risk of fire, do not use cleaning solvents in an area where a source of ignition may be present.

⚠️ Warning

Fluid under pressure
Escaping hydraulic fluid under pressure can have sufficient force to penetrate your skin causing serious injury and/or infection. This fluid may also be hot enough to cause burns. Use caution when dealing with hydraulic fluid under pressure. Relieve pressure in the system before removing hoses, fittings, gauges, or components. Never use your hand or any other body part to check for leaks in a pressurized line. Seek medical attention immediately if you are cut by hydraulic fluid.

⚠️ Warning

Personal safety
Protect yourself from injury. Use proper safety equipment, including safety glasses at all times.

⚠️ Warning

Product safety
Steering valves are safety components and therefore it is extremely important that the greatest care is taken when servicing these products. There is not much wear on a steering valve and therefore they normally outlast the application they are built into. Therefore the only recommended service work on steering valve is:

- Changing seals and O-rings
- Disassemble, clean and assemble if contaminated
- Make hydraulic testing including valve setting
EHi Steering Valve versions

**EHi versions**

This service literature is valid for any version of EHi, the exploded view is universal.

These modules/valve functions are present only in some versions of EHi:

- Reaction Switch Valve, RSV.
- Pilot reduction valves, PRV; in versions with RSV: 2 PRV's. In any other versions: 1 PRV.
- Priority Valve
- PVFC valve/LS resolver or LS shuttle valve, or none.
- Shock and suction valves.

Tools

**EHi Steering Valve holding tool**

It is recommended to use appropriate steel plate with mounting holes 3x Ø 10 mm matching mounting thread holes, C, on mounting side of EHi.

*Mounting dimensions for EHi holding tool*

![Diagram showing mounting dimensions for EHi holding tool]

*C parameters*

- M8 x 1.25
- 12 mm deep
Tools

Other required tools for EHi Steering Valve maintenance

A list of tools required for disassembly and reassembly of EHi Steering Valve for inspection and maintenance.

**Tool for removing/assembling pilot relief valve cartridge:**

Code Number: 15SL6494

**These tools are not available from Danfoss:**

- Torque wrench 0 - 70 Nm
- 13, 18, 19, and 32 mm socket spanner
- 2, 3, 4, 5, 6, 8, and 10 mm Hex keys
- 2mm screwdriver
- 13, 18, 19 mm, and 7/8 inch ring spanner.
- Inside circlip pliers
- Magnet, max outer diameter: 9 mm
- Tweezers (not pictured)
Disassembly

This section will show you how to fully disassemble the EHi Steering Valve for inspection, cleaning, and maintenance.

To disassemble EHi Steering Valve follow these steps.

Place the unit on the holding tool.
Use 3 pcs M8 x 1.25, length: 10 mm, plus thickness of console plate.

*EHi Steeering Valve mounted on holding tool.*

Remove PVE from housing

To remove the PVE from the EHi Steering Valve housing, follow these steps.

The PVE is attached to the housing with four screws. Five O-rings seal the unit in place, and a filter is also found between the unit and the housing itself.

*PVE parts and housing*

Wrench size and torque

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
<th>Wrench Size</th>

</tr>
</thead>
<tbody>
<tr>
<td>10 (x4)</td>
<td>Screw</td>
<td>5 mm internal hex</td>
<td>8 ± 1 N·m (70.8 ± 8.9 lbf·in)</td>
</tr>
</tbody>
</table>

1. Screw out the four screws (10) for PVE (4) using a 5 mm Hex key.
2. Remove the PVE (4).

O-rings (4.11, 4.12, and 4.13), and filter (4.9) are fitted to the mounting surface of the PVE.
Disassembly

One or more O-rings may stick to the EHi housing. Remove before proceeding.

Remove Coil from housing

To remove the Coil from the EHi Steering Valve housing, follow these steps.

Coil parts and housing

Wrench size and torque

<table>
<thead>
<tr>
<th>Item</th>

<td>Spool, pilot dump</td>
<td>7/8 inch external hex</td>
<td>15 ± 2 N•m [132.8 ± 17.7 lbf•in]</td>
</tr>
</tbody>
</table>

1. Screw off the nut (48) using a 19 mm socket or ring spanner.
2. Remove the O-ring (49) using a 2 mm flat head screwdriver.
3. Lift off the Coil (47).
4. Screw out the cartridge spool (46) using a 7/8 inch ring spanner.

O-rings (46.2, 46.3, and 46.4) are fitted on cartridge spool (46).

Remove Priority Valve from housing

To remove Priority Valve from the EHi Steering Valve housing, follow these steps.

The valve is removed in a three-step sequence, involving the plug, spring, and the spool.

Remove the Priority Valve

Priority Valve parts and housing
Disassembly

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
<th>Wrench size</th>
<th>Torque</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>

<td>1 ± 0.1 N•m [8.9 ± 0.9 lbf•in]</td>
</tr>
</tbody>
</table>

1. Screw out the plug (7) using an 18 mm socket or ring spanner.

   On EHi versions without priority valve, only plug (7) with hex key profile is present. Screw out this plug using an 8 mm Hex key.

   O-ring (7.2) is fitted to the plug.

2. Remove the spring (6).

3. Remove the priority valve spool (3).

   Remove priority valve spool with cincpli pliers.

   Orifices (3.2 and 3.3) are screwed into spool (3.1)

   Orifice (3.3) is not present in the "Static" type priority valve spool.

   a) Before removing orifices (3.2 and 3.3): fix the spool in a vice with aluminum jaws.
   b) Screw out PP orifice (3.2) using a 3 mm Hex key.
   c) Screw out dynamic orifice (3.3) using a 2 mm Hex key.
Disassembly

Remove Cut Off Valve from housing

Remove the cut off valve.

*Cut Off Spool parts and housing*

![Image of EHi Steering Valve showing Cut Off Spool parts and housing]

</tbody>
</table>

1. Screw out the plug (43) for the cut off spool using an 18 mm socket or ring spanner.
   O-ring (43.2) is fitted to the plug.
2. Remove the spring (41) for the cut off spool.
3. Remove the cut off spool (42).
   Plug (42.2) is present in some cut off spools (42.1).

Remove Reaction Switch Valve (RSV) from housing

To remove the Reaction Switch Valve (RSV) from the EHi housing, follow these steps.

If RSV (Reaction Switch Valve) is present:

*RSV parts and housing*

![Image of EHi Steering Valve showing RSV parts and housing]
Disassembly

</tbody>
</table>

1. Screw out the plug (32) using an 18 mm socket or ring spanner.
   O-ring (32.2) is fitted to the plug.
2. Remove the spring (31).
3. Remove the RSV spool (30).

Remove PVFC/LS copy or LS shuttle valve from housing

To remove PVFC/LS copy or LS shuttle valve from EHi Steering Valve housing, follow these steps.
• If PVFC/LS copy valve is present, perform steps 1-3, below.
• Alternative is LS shuttle valve (parts 88 and 87), in that case, follow steps 4 and 5, below.
• If there is no valve at all, only plug (88) will be present. Screw out this plug as described in step 4, below.

Remove the PVFC valve:

PVFC valve parts and housing

Wrench size and torque

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
<th>Wrench size</th>
<th>Torque</th>
</tr>
</thead>
<tbody>
<tr>
<td>27</td>
<td>Plug with O-ring</td>

<tr>
<td>24.3</td>
<td>Check Valve</td>
<td>-</td>
<td>1.4 ± 0.2 N•m [12.4 ± 1.8 lbf•in]</td>
</tr>
</tbody>
</table>

1. Screw out the plug (27) using an 8mm Hex key.
   O-ring (27.2) is fitted to the plug.
2. Remove the spring (26).
3. Remove the PVFC spool (24).

Some PVFC spools have check valves (24.2 and 24.3), which are screwed into spool (24.1).
If the PVFC/LS copy valve is absent, and the LS shuttle valve (88 and 87) is present instead, perform the following steps:
Disassembly

**LS Shuttle valve/plug and housing**

![Diagram of LS Shuttle valve/plug and housing](image)

**Wrench size and torque**

<table>
<thead>
<tr>
<th>Item</th>

<td>10 ± 1 N•m [88.5 ± 8.9 lbf•in]</td>
</tr>
</tbody>
</table>

4. Screw out the plug (88) using a 5 mm Hex key.
   O-ring (27.2) is fitted to the plug.

5. Screw out the shuttle valve (87) using a 5 mm Hex key.
   O-rings (2x 87.3 and 87.5) are fitted to the valve.

**Remove Pilot reduction valve(s) from housing**

To remove Pilot reduction valve(s) from EHi Steering Valve housing, follow these steps.

These steps will explain how to remove the pilot valve or valves from the EHi Steering Valve housing. If there is a second valve (17, 18, 19, and 20 are present), repeat these three steps for each valve.

Remove the Pilot reduction Valve(s)

**Pilot reduction valve(s) parts and housing**

![Diagram of Pilot reduction valve(s) parts and housing](image)

**Wrench size and torque**

<table>
<thead>

<td>Plug</td>
<td>6 mm internal hex</td>
<td>20 ± 3 N·m [177 ± 26.6 lbf·in]</td>
</tr>
</tbody>
</table>

1. In EF, P, and T-side-ports: screw out the plug (252, 255, and 256) using a 10 mm Hex key.
   Seal ring is fitted to the plug.

2. In CF-side-port: screw out the plug (257) using an 8 mm Hex key.
   Seal ring is fitted to the plug.

3. In LS1 and LS2-ports: screw out the plug (258 and 259) using a 6 mm Hex key.
   Seal ring is fitted to the plug.

4. Screw out the orifice (22) using a 3 mm Hex key.
   If the EHi has LS-orifice, it is placed behind the LS1-port (258).
Disassembly

**Fully disassembled EHi**

To properly maintain and clean the now fully dismantled EHi Steering Valve, follow these steps. This task illustrates the basic procedures for examining, cleaning, and maintaining EHi Steering Valve.

1. Check your own parts against those pictured below.
   *All parts except housing are illustrated*

![Diagram of fully disassembled EHi Steering Valve](image)

Cleaning:

2. Clean all parts carefully in Shellsol K or similar cleaner fluid.

Inspection and replacement:

3. Replace all O-rings. Check all parts carefully for damage.
   
   In case any part appears damaged, or in case disassembly of any part was difficult or impossible, consider the EHi housing as damaged and replace the entire EHi valve.
Assembly

To assemble EHi Steering Valve, follow these steps.
Place EHi housing on holding tool.
Use 3 pcs M8 x 1.25, length: 10 mm + thickness of console plate.

Address seal kit

Place new O-rings from seal kit on plugs except on port plugs for which there are no seal rings/O-rings available.
The seal kit contains plugs with O-rings, (16 and 20), so these plugs shall be replaced.
Plugs (2x82) with O-rings are present in dedicated spare part bag only, see Seal kits and spare parts for EHi on page 9.

1. Screw in the PP orifice (3.2) using a 3 mm Hex key. 
   Torque: 3.5 ± 0.5 N·m \( [31 ± 4.4 \text{ lbf} \cdot \text{in}] \)

2. If present: screw in the dynamic orifice (3.3) using a 2 mm Hex key. 
   Torque: 1 ± 0.1 N·m \( [8.9 ± 0.9 \text{ lbf} \cdot \text{in}] \)

3. Insert the priority valve spool (3) with the spring bore pointing outwards.

4. Insert the spring (6).

5. Place O-ring (7.2) on the plug (7.1).

6. Screw in the plug (7) using an 8 mm Hex key. 
   Torque: 45 ± 5 N·m \( [398.3 ± 44.3 \text{ lbf} \cdot \text{in}] \)

### Insert cut off valve into housing

#### Cut off valve parts and housing

1. If cut off spool (42) has plug (42.2), screw in the plug using a 3 mm Hex key and multi grip pliers. 
   3.5 ± 0.5 N·m \( [31 ± 4.4 \text{ lbf} \cdot \text{in}] \)

2. Insert the cut off spool (42) with the spring bore pointing outwards.

3. Place O-ring (43.2) on the plug (43.1).

4. Insert the spring (41) in the plug (43).

5. Screw in the plug (43) using an 18 mm socket spanner. 
   Torque: 45 ± 5 N·m \( [398.3 ± 44.3 \text{ lbf} \cdot \text{in}] \)

### Insert reaction switch valve (RSV) into housing

If RSV is present:
Assembly

RSV parts and housing

1. Insert RSV spool (30) with the spring bore pointing outwards.
2. Place O-ring (32.2) on the plug (32.1).
3. Insert the spring (31) in the plug (32).
4. Screw in the plug (32) using an 18 mm socket spanner.
   Torque: 45 ± 5 N-m [398.3 ± 44.3 lbf-in]

Attach coil to housing

Coil parts and EHi housing

1. Place O-rings (46.2, 46.3, and 46.4) on spool (46.1).
2. Screw in the cartridge spool (46) using a 7/8 inch ring spanner or long socket spanner.
   Torque: 15 ± 2 N-m [132.8 ± 17.7 lbf-in]
Assembly

3. Place the coil (47).

4. Place the O-ring (49).

5. Screw on the nut (48) using a 19 mm socket spanner.
   Torque: $5 \pm 1 \text{ N-m} \ [44.3 \pm 8.9 \text{ lbf-in}]$

Attach PVE to housing

*PVE parts and housing*

1. Check proper movement of EH spool (2): press on spool end, the spool must be able to be moved downwards 4 mm with force < 100 N [22.48 lbf], and it must be able to return to starting position by help of the neutral spring package integrated in the spool end facing plug (2).

*Press on spool end*
Assembly

2. Place O-rings (4.11, 4.12, 4.13) and filter (4.9) on PVE (4.1).

   Place O-rings on PVE

3. Place the PVE(4) on EHi housing and screw in the four screws for the PVE (10) using a 5 mm Hex key.
   
   $8 \pm 1 \text{ N}\cdot\text{m} \ (70.8 \pm 8.9 \text{ lbf}\cdot\text{in})$

4. Make test and valve settings according to description in the following pages.

5. Screw in plastic plugs to the connections ports to keep the ports clean during storage and transportation.

   Steel plugs in EHi ports
This section describes minimum tests needed, when the EHi steering valve has been disassembled and reassembled.

Example of system setup: EHi5, Load Sensing Reaction to be used with OSPC LSR type steering unit:

Setup for testing

Use universal hydraulic work bench with pump capacity:
40 l/min [10.6 gal/min] and up to 280 bar [4061 PSI] pressure for relief valve setting and steering test.
Testing of EHi

The hydraulic oil must be with a viscosity of 21 cSt at 50°C [122°F] and with maximum degree of contamination according to ISO 4406: 21/19/16.

EHi for LS steering units

Description for system setup, when priority valve is integrated in EHi and when EHi is configured to be used with LS type steering unit (as illustrated in system diagram above, EHi5):

1. Connect double rod cylinder to CL and CR ports of EHi.
2. Connect front T and EF port of EHi to tank of pump station.
3. Connect the front P port of EHi to P port from pump.
4. Connect the side P port of EHi to P port of LS steering unit.
5. LS1 of EHi:
   a) When using pump station with fixed gear pump: Plug LS1 with steel plug
   b) With LS pump in pump station: connect LS1 of EHi to LS of pump.
6. LS2 of EHi (is only present in EHi’s with PVFC spool to be used for dynamic type steering units):
   connect LS2 to LS port of OSP steering unit. LS dynamic flow will stream out of LS2 port of EHi, and must be able to pass on to tank.
7. Connect side T of EHi to T port of OSP.
8. Connect L and R of EHi to L and R of OSP.
9. Connect pressure gauges to all ports of EHi.
10. Connect voltage supply and signal input for the PVE.

T pressure should not exceed ~5 bar [73 PSI]. Maximum allowed T pressure is 25 bar [363 PSI].
Pump supply circuit must be adjusted not to exceed 280 bar [4061 PSI] P-T.
In case the EHi has no RSV the OSP steering unit can be omitted from the tests.
Testing of EHi

**EHi for open center steering units**

Description for system setup, when priority valve is integrated in EHi and when EHi is configured to be used with open center type steering unit (as illustrated in system diagram, EHi2).

**Example of system setup: EHi2, Open center Reaction to be used with OSPC OR type steering unit:**

1. Connect double rod cylinder to CL and CR ports of EHi.
2. Connect T port of EHi to tank of pump station.
3. Connect the front P port of EHi to P port from pump. Plug the side P port of EHi.
4. Connect EF port of EHi to P port of OSP steering unit.
5. LS1 of EHi to be plugged (only gear pump or pump providing fixed flow can be used for this EHi system)
6. LS2 of EHi to be plugged.
7. Connect side T of EHi to T port of OSP.
Testing of EHi

8. Connect L and R of EHi to L and R of OSP.
9. Connect pressure gauges to all ports of EHi.
10. Connect voltage supply and signal input for the PVE.

In case the EHi has no RSV the OSP steering unit can be omitted from the tests. For EHi without integrated priority valve and with fixed gear pump in pump station, use external priority valves:

- For dynamic systems (when PVFC is present in EHi): Use Danfoss priority valve OLS 80 Code 152B8269, or other OLS 80 with same orifice and spring specification. Dynamic orifice: Ø1.0 mm. LS orifice: Ø1.2 mm. Spring: 7 bar [102 PSI].
- For static systems (when PVFC is not present in EHi): Use Danfoss priority valve OLS 80 code 152B0263, or other OLS 80 with same spring specification: 10 bar [145 PSI].
Steering tests

Apply battery power and input signal to the PVE.
- With PVED CLS: The coil must be connected to and actuated by the PVED CLS.
- With other PVEs: connect DC voltage and ground to the coil (12V or 24V depending on voltage marking on the coil).

Start up test

During the testing no disturbing vibrations, noise, or other irregularities must occur.

1. Start the pump, the pump flow is adjusted to approximately 25 l/min and pump pressure control must be set to approximately 70 bar [1015 PSI].
2. Let the supplied oil flow through the steering valve for a few minutes. Then actuate the PVE a few times in both directions to bleed of air from the EHi and the system. Observe that the steering cylinder is moving according to direction of input signal for PVE.
3. Operate the PVE to move the steering cylinder from end stroke to end stroke for at least 5 cycles. Make sure pressure P-T, 70 bar [1015 PSI] can be achieved, when steering against end stroke. If this is not possible, the adjusting screw of the pilot relief valve (item 95 of exploded view) must be turned clockwise until P-T, 70 bar [1015 PSI] is achievable.

Pilot relief valve

1. The pump flow is adjusted to approximately 25 l/min [6.6 gal/min] and pressure to max 280 bar [4061 PSI].
2. Steer the cylinder to an end stroke, keep input signal on PVE for full spool travel.
3. The pilot relief valve (item 95 of exploded view) is set according to specification:
   - Maximum steering pressure (P-T), bar, for the code in question.
   - The setting pressure is the pressure on the P-port minus the T-port of EHi.

Neutral positioning test

1. Apply input signal to the PVE to make a cylinder movement.
2. Remove input signal to the PVE, the steering valve must be able to go to neutral later than ~1 second: cylinder movement must stop.
3. The EHi is proper in neutral position when the pressure drop (LS1-T of EHi) is no higher than 10 bar [145 PSI] at pump flow 25 l/min [6.6 gal/min], and there must be no movement of the steering cylinder.

Cut off valve test

The cut off valve spool movement can be controlled by:
1. With electric power on coil and on PVE and with signal on PVE, the steering cylinder must move to end stroke and maximum steering pressure must be build up.
2. Steer in opposite direction to observe cylinder movement.
3. While cylinder is moving, remove electric power to the coil (keep battery power and signal to PVE): cylinder movement must stop and pressure (LS1-T of EHi) must drop to be no higher than 10 bar [145 PSI].

RSV valve test

If the EHi is equipped with an RSV valve, spool movement can be controlled by:
Steering tests

1. With electric power on coil and on PVE and with signal on PVE, the steering cylinder must move to end stroke and maximum steering pressure must be build up.

2. Steer in opposite direction to observe cylinder movement. Apply input for slow movement of cylinder, < 25% of max. signal.

3. Activate steering wheel to steer in opposite direction as movement of cylinder: cylinder movement speed shall decrease/change to opposite direction dependent on steering wheel speed. Steering wheel torque must not exceed 10 N•m [88.5 lbf•in], when cylinder moves inside end strokes.
Check for external leakage

1. Remove the port connections, after testing the former items.
2. 2xP, CF, LS1, LS2, T-side, EF, L, R, CL and RL ports are to be plugged w. steel plugs.
3. Oil pressure of 20 bar [290 PSI] is supplied to the T-front port for approx. 3 minutes. No leakage must be found in any assemblies.
Shock valves

If the EHi is equipped with shock valves, these are preset and locked in setting from factory. Solely no adjustments can be made on these valves.

Danfoss Power Solutions is a global manufacturer and supplier of high-quality hydraulic and electronic components. We specialize in providing state-of-the-art technology and solutions that excel in the harsh operating conditions of the mobile off-highway market. Building on our extensive applications expertise, we work closely with our customers to ensure exceptional performance for a broad range of off-highway vehicles.

We help OEMs around the world speed up system development, reduce costs and bring vehicles to market faster.

Danfoss – Your Strongest Partner in Mobile Hydraulics.

Go to www.powersolutions.danfoss.com for further product information.

Wherever off-highway vehicles are at work, so is Danfoss. We offer expert worldwide support for our customers, ensuring the best possible solutions for outstanding performance. And with an extensive network of Global Service Partners, we also provide comprehensive global service for all of our components.

Please contact the Danfoss Power Solution representative nearest you.
