Introduction
Superheat controller EKE 1C is for use where superheat must be accurately controlled, typically in commercial air conditioning, heat pumps, commercial refrigeration, food retailing and industrial applications.
Compatible valves: Danfoss ETS 6 / ETS / ETS Colibri®, KVS / KVS Colibri® and CCM / CCMT / CTR valves.
Reference: For details please see EKE data sheet.

Applications

1. Superheat controller: standalone / network

2. Valve driver

Dimensions EKE 1C

Weight: 190 gram

PLASTIC HOUSING FEATURES
- DIN rail mounting complying with EN 50022
- Self-extinguishing V0 according to IEC 60695-11-10 and glowing hot wire test at 960 °C according to IEC 60695-2-12
- Ball test: 125 °C according to IEC 60730-1. Leakage current: ≥ 250 V according to IEC 60112

OTHER FEATURES
- Operating conditions CE: -20°C to 60°C, 90% RH non-condensing
- Storage conditions: -30°C to 80°C, 90% RH non-condensing
- To be integrated in Class I and/or II appliances
- Index of protection: IP 20 on product and IP 40 only on the front cover
- Period of electric stress across insulating parts: long
- Suitable for using in a normal pollution environment
- Immunity against voltage surges: category II
- Software class and structure: class A
- Category of resistance to heat and fire: D

CE COMPLIANCE
This product is designed to comply with the following EU standards:
- Low voltage guideline: 2014/35/EU
- Electromagnetic compatibility EMC: 2014/30/EU and with the following norms:
  - EN61000-6-1, EN61000-6-3 (immunity for residential, commercial and light-industrial environments)
  - EN61000-6-2, EN61000-6-4 (immunity and emission standard for industrial environments)
  - EN60730 (Automatic electrical controls for household and similar use)

GENERAL WARNINGS
- Every use that is not described in this manual is considered incorrect and is not authorized by the manufacturer
- Verify that the installation and operating conditions of the device respect those specified in the manual, especially concerning the supply voltage and environmental conditions
- This device contains live electrical components. All service and maintenance operations must therefore be performed by qualified personnel
- The device must not be used as a safety device
- Liability for injury or damage caused by the incorrect use of the device lies solely with the user

INSTALLATION WARNINGS
- Recommended mounting position: vertical
- Installation must comply with local standards and legislation
- Before working on the electrical connections, disconnect the device from the main power supply
- Before carrying out any maintenance operations on the device, disconnect all electrical connections
- For safety reasons the appliance must be fitted inside an electrical panel with no live parts accessible
- Do not expose the device to continuous water sprays or to a relative humidity greater than 90%
- Avoid exposure to corrosive or pollutant gases, natural elements, environments where explosives or mixes of flammable gases are present, dust, strong vibrations or shock, large and rapid fluctuations in ambient temperature that might cause condensation in combination with high humidity, strong magnetic and/or radio interference (e.g. transmitting antennae)
- When connecting loads be aware of the maximum current for each relay and connector
- Use cables ends suitable for the corresponding connectors. After tightening connector screws, tug the cables gently to check their tightness
- Use appropriate data communication cables. Refer to the EKE data sheet for the kind of cable to be used and setup recommendations
- Minimize the length of probe and digital input cables as much as possible, and avoid spiral routes around power devices. Separate from inductive loads and power cables to avoid possible electromagnetic noises
- Avoid touching or nearly touching the electronic components fitted on the board to avoid electrostatic discharges

PRODUCT WARNINGS
- Use a class II category transformer for 24 V AC power supply.
- Connecting any EKE inputs to mains voltage will permanently damage the controller.
- Battery Backup terminals does not generate power to recharge a device connected.
- Battery backup - the voltage will close the stepper motor valves if the controller loses its supply voltage.
- Do not connect an external power supply to the digital input DI terminals to avoid damaging the controller.
DIN rail mounting / demounting
The unit can be mounted onto a 35 mm DIN rail simply by snapping it into place and securing it with a stopper to prevent sliding. It is demounted by gently pulling the stirrup located in the base of the housing.

Important Note

- Mount the sensor on a clean paint-free surface.
- Remember to use heat conducting paste and insulate the sensor.
- For precise measurements, mount the sensor max. 5 cm from the outlet of the evaporator.

Pressure transmitter

- Installation of the pressure transmitter is less critical. However, the pressure transmitter should be closer to the temperature sensor, right after the evaporator and with its head upright. It is a good practice to select a pressure transmitter with an average load of 40 – 60% of full scale.
- Pressure transmitter values can be shared with multiple EKE 1C via CANbus.

Power supply

- Power sharing is allowed in EKE controller.
- It is a good practice not to reverse the polarity of the power connection cables. Selection of the common power supply depends on the total number of sharings and the valve in use.
**Connecting Modbus**

- For the MODbus cable, it is best to use 24 AWG shielded twisted-pair cable with a shunt capacitance of 16 pF/ft and 100Ω impedance.
- The controller provides an insulated RS485 communication interface which is connected to the RS485 terminals (see connection overview).
- The max. permissible number of devices simultaneously connected to RS485 cable output is 32. The RS485 cable is of impedance 120 Ω with maximum length of 1000 m.
- Terminal resistors 120 Ω for terminal devices are recommended at both ends.
- The EKE communication frequency (baud rate) can be one of the following: 9600, 19200 or 38400 baud, default 19200 8 E 1.
- The default unit address is 1, which can be changed using parameter “G001 Controller adr.”.

**Cable length**

EKE controller supports the following max. cable length.

<table>
<thead>
<tr>
<th>Cable length</th>
<th>Wire size min. / max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>[m]</td>
<td>[mm²]</td>
</tr>
<tr>

<tr>
<td>Digital output</td>
<td>–</td>
</tr>
<tr>
<td>Digital MMI</td>
<td>max. 3 over CAN RJ</td>
</tr>
<tr>
<td>Communication bus</td>
<td>max. 1000</td>
</tr>
</tbody>
</table>

**Cable and wiring *)**

- The max. cable distance between the controller and the valve depends on many factors like shielded/ unshielded cable, the wire size used in the cable, the output power for the controller and EMC.
- Keep controller and sensor wiring well separated from mains wiring.
- Connecting sensors by wires more than the specified length may decrease the accuracy of measured values.

**Warning**

Separate the sensor and digital input cables as much as possible (at least 10 cm) from the power cables to the loads to avoid possible electromagnetic disturbance. Never lay power cables and probe cables in the same conduits (including those in the electrical panels).

![Modbus connection diagram](image-url)
Stepper Motor Output
- All valves are driven in a bipolar mode with a 24V supply chopped to control the current (Current driver).
- The stepper motor is connected to the “Stepper Valve” terminals (see terminal assignment) with a standard M12 connection cable.
- To configure stepper motor valves other than Danfoss stepper motor valves, the correct valve parameters must be set as described in the Valve configuration section (see manual for details).
- The default valve setting in EKE 1C is: none.
- The correct valve must be defined in “Valve configuration”, i.e. parameter I067. An overview of valve types is given in the “Parameter identification” section.

Guideline for long M12 cables on Danfoss stepper motor valves
- Long cables will lead to degradation of performance.
- You can overcome this degradation by changing the settings for the valve driver. This guideline is based on the cable type being the same type as the standard Danfoss stepper motor cable.

Recommended wire size and cable distance between EKE controller and stepper motor valve

<table>
<thead>

KoolProg is a software tool for quickly and easily configuring EKE controllers. It enables you to make online changes to parameter configuration, copy settings to multiple controllers, monitor the live status of input / outputs, and quickly analyze controller behavior and program patterns with a graphical trending tool.

KoolProg Software is available for download free of charge at [http://koolprog.danfoss.com](http://koolprog.danfoss.com).

KoolProg requires a Gateway (code 080G9711) to connect to the PC.

**Important note!**
To guarantee a reliable USB connection to a host device (e.g. industrial PC), you must:
- Connect terminals R and H on MMIMYK CAN port using a termination wire.
- Place cable holder close to MMIMYK to keep USB connector firmly in place.
- Keep USB cable length < 1 m.
- Place MMIMYK and route USB cable far from noise sources (inverter, motors, contactors etc.)
Danfoss MMIGRS2 display

Connecting external MMIGRS2 display
MMIGRS2 display can be used to set up EKE 1C. The display can be used not only for setting up the necessary parameters, but also as an external display during operation to show important parameters, e.g. degree of opening of valve, superheat, etc.

Important note:
- Max. distance between controller and display is 3 m over CAN RJ.
- CANbus requires termination in both ends of the cable by a 120 Ohm resistor to ensure reliable communication.
- On EKE 1C and MMI, the termination must be included by shorting CAN R and CAN H with a wire.

MMIGRS2 (Back view)

MMIGRS2 (Front view)

Note: Setup and service menu requires login with the default password 100 (daily use), 200 (service use) or 300 (commissioning use). Long press Enter key to access login menu.
Setup wizard via MMIGRS2 display

When all connections to the controller have been made, after the power is switched on, the Danfoss logo will appear for 5 seconds, then the Home screen will be displayed.

To access the Wizard: press and hold enter to access the Login screen, the commissioning password is 300, scroll down the Setup and service menu and select “Setup wizard”.

When using the Setup Wizard, repeat the following sequence for all parameter settings:

a. From Setup wizard, select relevant parameters.
   - Press ENTER to highlight 1st option
   - Scroll with UP / DOWN to your desired option
   - If the selected default value is acceptable, press DOWN to get to the next settings. Otherwise,
   - press ENTER to set your choice
   - Scroll with DOWN to the next parameter (repeat sequence a. to e.)

Note:

- If you do not have sufficient information to complete the Wizard, leave settings on their default values. To generate the requested info, you can use Danfoss Coolselector2 software to calculate operating conditions and valve OD for the same operating point.
- Setup Wizard only covers the most important parameters. If other features are to be enabled (e.g. Alarm settings, MOP/LOP, etc.), they must be configured separately once the Setup Wizard is done.
- Setup Wizard is also available in KoolProg PC tool.
- The workflow process is the same as that described above for MMIGRS2 display.
- For details, please refer to EKE data sheet.
Quick guide for parameter selection

Apart from wizard setup, users can also use the following section which describes quick parameter settings for general applications.

Start: Main switch = Off

Select valve type

Application mode
Driver-Controller

Analog signal type e.g. 1-5V / 0-20mA.
Parameter 1033 Driver reference configuration,
1034 Ext ref voltage low,
1035 Ext ref. voltage high
1036 Ext ref. current low
1037 Ext ref. current high.

Select Refrigerant

Select Temperature sensor

Select Pressure transmitter

Define Min/Max Pressure

Select Superheat Control

Set Min/Max Ref value

Select Other features

Finish: main switch = ON

Make sure that main switch is OFF before changing the settings. The setting will depend on the system requirement.
Parameter: R012 Main Switch

Select predefined Danfoss valve type ETS, ETS C, KVS, KVS C, CCM, CCMT, CTR, or user defined.
Parameter: 1067 Valve configuration

Select how you want to use EKE: driver or superheat controller.
Parameter: R102 Operation mode

Select the predefined refrigerant.
Parameter: O030 Refrigerant

Select Temperature sensor type: EKS, ACCPBT, MBT, Sensata 112CP, Bus Shared, AKS
Parameter: 1040 - S2 sensor.
Check parameter list for other sensors.

Select Pressure transmitter type –AKS 32R, Sensata 112CP, OEM Ratio, NSK, AKS 32 1 - 5V, OEM Voltage, Bus shared, AKS 32 1 - 6V, AKS 32 0 - 10V, AKS 33, XSK, ACCPBP Current, OEM Current
Parameter: 1043 - Pe transmitter configuration.
Check parameter list for other sensors.

Define min and max Pressure transmitter in barg.
Parameter: O020 - Pe min., O021 - Pe max., Check parameter list for other sensors.

Select application control type SH control. 1: MSS, 2: LoadAp, 3: Fixed, 4: Delta SH.
Parameter: N021 SH reference mode.

Set the value for the selected control min./max. superheat reference.
Parameter N009 SH max., N010 - SH min.

Optional – Force start up, MOP, LOP, Alarm, Thermostat function.
Check parameter list for details.

Remember to turn on main switch to start ‘ON’.
Parameter R012 Main switch.
### EKE 1C – Commonly used parameter identification

**PNU** - equivalent to the Modbus register no. (Modbus address +1).

Actual value are read/written as 16-bit integer values without decimals. This is the default value as read via Modbus.
