

Data sheet

Thermostatic water valve AVTB

Application

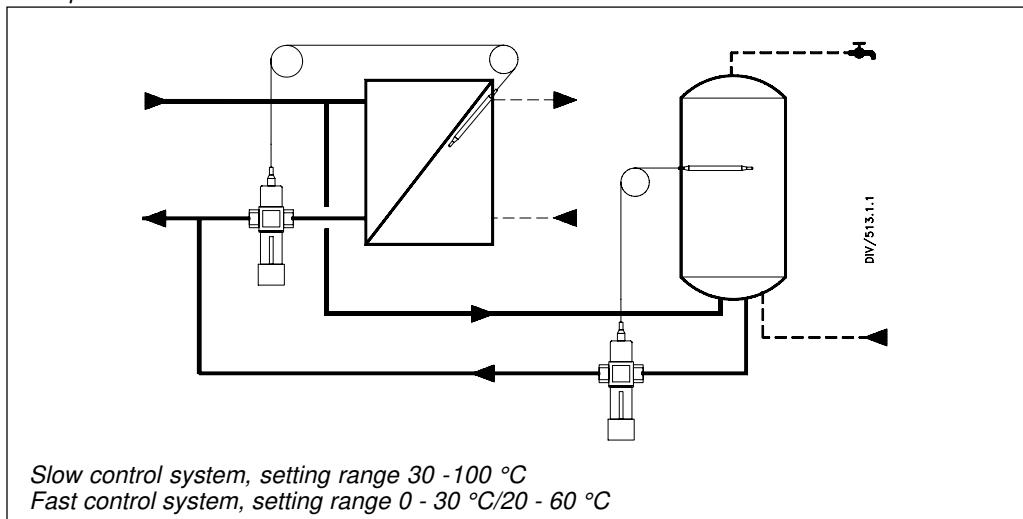

Description

- Self-acting
- Closes on rising temperature
- Can be fitted in the flow or return depending on sensor type
- Pressure range PN 16, max. 130 °C

The complete AVTB valve has a setting knob, a valve body, a bellows element with capillary tube and a sensor pocket.

The valve is used to control the water temperature in hot water tanks, heat exchangers, oil preheaters, etc.

¹⁾ Complete control including capillary tube gland. The sensor pocket is an accessory.

²⁾ Including small sensor Ø 9,5 x 180. The sensor is to be mounted where the system temperature is warmer than the temperature in the valve housing.

³⁾ Including small sensor Ø 9,5 x 150. Capillary tube length 2,3 m.

⁴⁾ Delivered on order.

Capillary tube length: 2 m.

Materials, parts in contact with water

Diaphragms in valve body: EPDM-rubber
Spindle: Dezincling-free brass
BS 2872/CZ132

Valve seat: Cr Ni steel, DIN 17440, w.no. 1.4301

Valve cone: NBR-rubber
O-rings: EPDM-rubber

Valve bodies with internal thread

Valve body: MS 58, hot-pressed, DIN 17660, w.no. 2.0402, CuZn40Pb2

Valve body with external thread
Valve body: Dezincling-free brass, BS 2872/CZ132
Other metal parts: Dezincling-free brass, BS 2874/CZ132

Sensor: Copper

Sensor charge:
0 - 30 °C: R 152 A, C₂H₄F₂
20 - 60 °C: Butane R600, C₄H₁₀
30 - 100 °C: Carbon dioxide, CO₂

Data sheet

Thermostatic water valve AVTB

Data

Flow temperature $-25 - +130^{\circ}\text{C}$
 Max. working pressure 16 bar
 Max. differential pressure 10 bar
 Max. test pressure 25 bar

Sizing

Example

Hot water temperature control in hot water tanks.

Primary medium: Water.

Given

Load: 31 kW
 (26500 kcal/h)

Primary temperature drop Δt : 20 K

Differential pressure Δp across the valve: 1.7 bar

Max. hot water temperature: 55 °C

$$\text{Water volume } Q: \frac{31 \times 0.86}{20} = 1.3 \text{ m}^3/\text{h}$$

Required

The correct valve size
 Temperature range and P-band

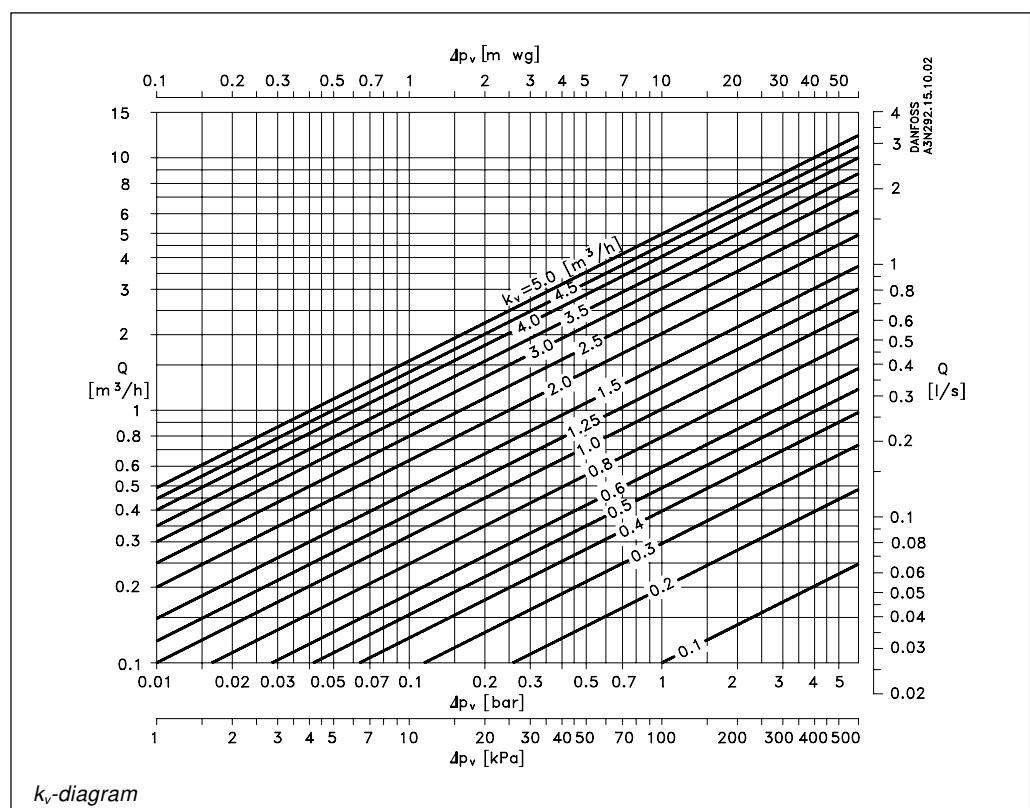

Method

Using Q and Δp , the necessary k_v value can be read from the k_v diagram, in this example k_v -value = 1. From this value on the k_v scale in the AVTB diagram, take a line horizontally to intersect the columns for recommended sizing range. Select the smallest possible valve, here an AVTB 15. A temperature range of 30 -100 °C can be assumed as suitable for this example.

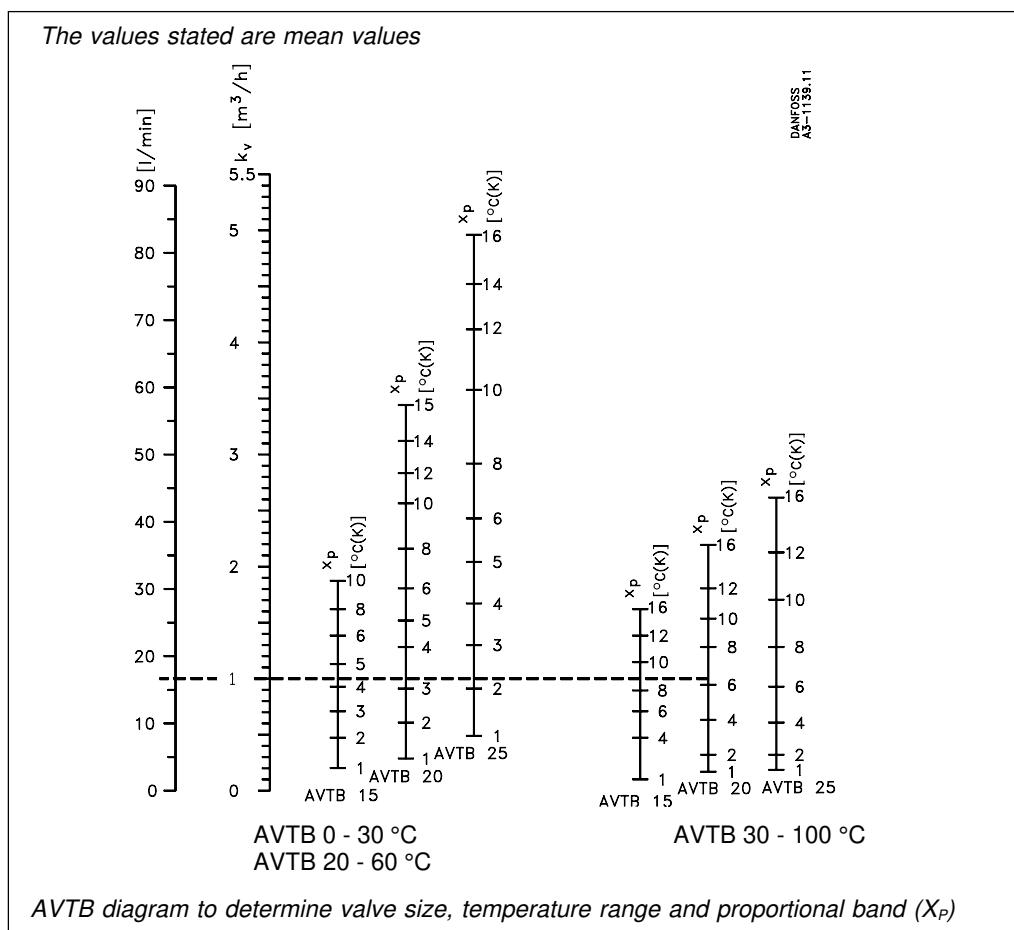

The P-band (X_p) and final temperature range can also be read from the AVTB diagram. The required closing temperature can be read from the scale for the valve selected. However, there are two temperature ranges that meet the requirement for a closing temperature of 55 °C.

X_p is 9 K for the range 30 -100 °C, which means that the control will yield the calculated capacity at a sensor temperature of 55 °C minus 9 K = 46 °C. For the range 20 -60 °C X_p = 4 K. This means that the control will yield the calculated capacity at 55 °C minus 4 K = 51 °C.

To ensure the most stable control an AVTB 15 with a range 30 -100 °C should be chosen. The water in the hot water tank will reach the closing temperature (55 °C) only when there has been no hot water demand for some time.

Sizing

Installation

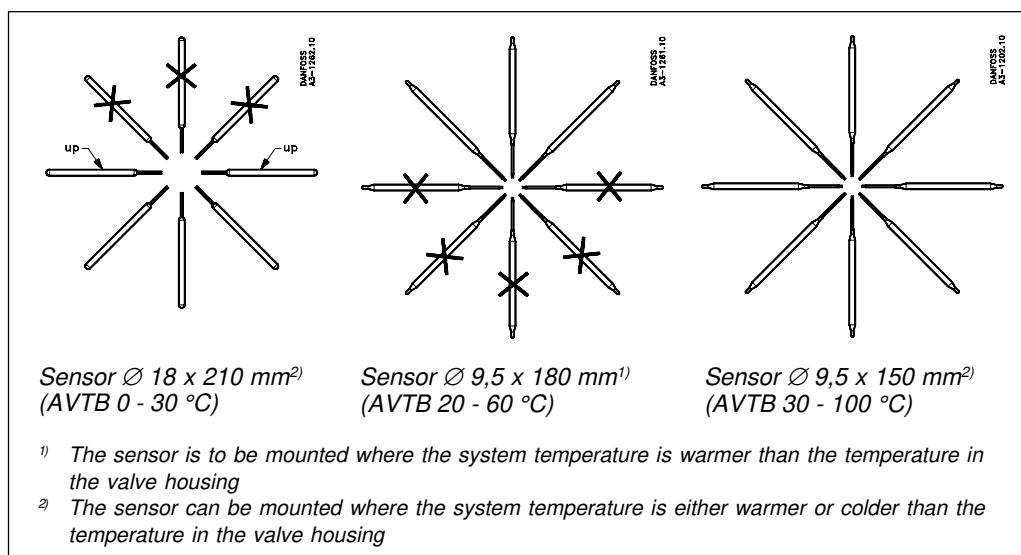

The valve can be installed in any position, with flow in the direction of the cast-in arrow.

AVTB 20 - 60 must always be installed in the return flow (sensor warmer than valve).

If AVTB 20 - 60 has been installed in the return flow from a service water heat exchanger (where for certain periods the return temperature approaches the sensor temperature) the installation of insulation disk is recommended (003N4022).

AVTB 0 - 30 and 30 - 100 can be installed in either the flow or return.

With AVTB 30 - 100, if temperature variations of more than 20 °C occur at the valve, insulation disk (003N4022) must be used between bellow element and valve body.

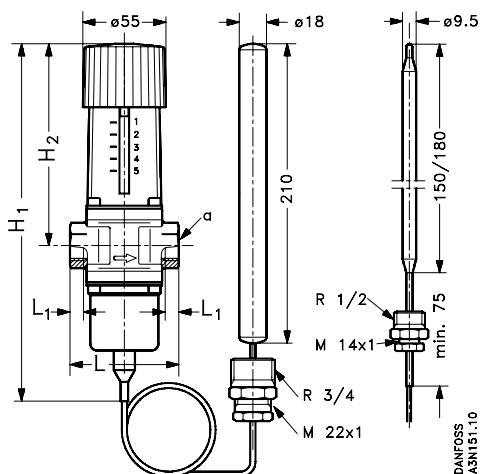

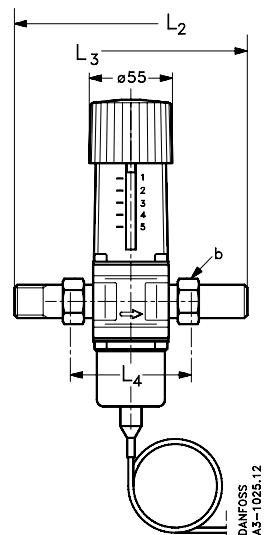

Data sheet
Thermostatic water valve AVTB
Setting

Relation between scale figures 1-5 and the closing temperature.

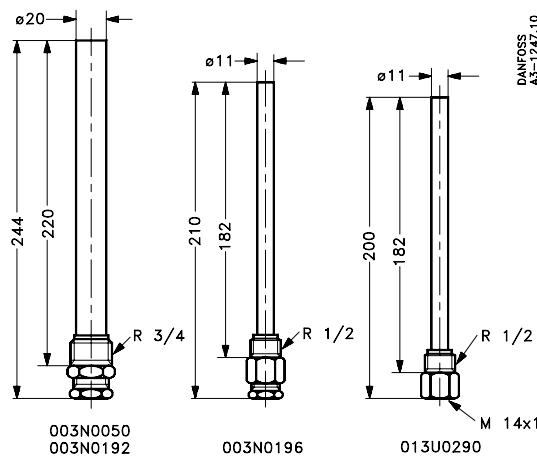

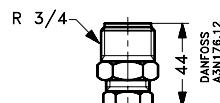

The values given are approximate.

Scale setting	1	2	3	4	5	
Closing temperature (0-30 °C)		0	3	15	23	30
(20-60 °C)	20	35	50	60	70	
(30-100 °C)	30	55	75	95	120	°C
