Introduction to PVE Piston Pumps

Danfoss PVE piston pumps are inline, variable displacement pumps that are available in three displacement sizes. An assortment of optional controls offer maximum operating flexibility.

Pump displacement is varied by means of pressure and/or flow compensator controls.

Features and Benefits

- Inline, variable displacement pump
- Displacement is varied by pressure/flow compensator controls
- Optional controls for maximum operating flexibility
- Thru-drive available on PVE 19/21

PVE012 Section V iew

PVE012 Section V iew

Figure 1. Sectional V iews of the PVE Pumps

Pressure Compensator Control, "A" Option

This control automatically varies pump displacement to meet the system flow demand for a constant system pressure. Displacement starts to reduce to zero within 14 bar (200 psi) of the compensator setting. Power draw-off is minimized, therefore, system relief valves should not be required.

Pressure Compensator Control with Maximum Displacement Adjustment

As indicated for "A" option above, except there is an independent screw adjustment of maximum displacement from 100% (rated) to 25%.

Note: Graphic symbols shown with external valve(s) and cylinder to illustrate typical usage.

Load Sensing Compensator and Pressure Limiter, "B" Option

This compensator provides load sensing control under all pressure conditions up to the desired maximum. It automatically adjusts pump flow in response to a remote pressure signal and maintains outlet pressure at approximately 11 bar (160 psi) above load pressure. The integral pressure limiter overrides the load sensing control, reducing pump displacement as the preset maximum operating pressure is reached. Override begins within 14 bar (200 psi) of the preset maximum pressure compensator setting. A 24 bar LS option is also available.

Note: Optional internal bleed orifice diameter is .015" and is "A" option-control special features.

PVE with Pressure Compensator Arranged for Remote Control, "D" Option or "J" Option

Exactly the same as the "A" (pressure compensation option) except the machine operator is able to change the compensator setting through the use of a remote pilot relief valve.

Note: A kit is available for an electrical dual pressure compensator. This control automatically adjusts pump delivery to maintain system volume requirements at either of two preselected operating pressures. This allows lower settings for low horsepower start-up, equipment testing, etc. This kit also allows for higher pressure settings as required in machine applications. For details refer to service drawing I-3255-S.

Operating Data

Displacement Speed, and Pressure Ratings

Preparation for Start-up

Before starting a PVE pump, fill the case through the uppermost drain port with clean system hydraulic fluid. The case drain line must be connected to the reservoir below oil level. For multiple pump arrangements that include non-PVE sections, the requirements of the non-PVE units must also be considered.

Mounting

Danfoss Hydraulics recommends these PVE series piston pumps be mounted horizontally.

Displacement, Speed and Pressure Ratings

Model Number System	Displacement cm ³ /r (in ³ /r)		Rated Input Speed (At 0 psig Inlet)	Maximum Pressure bar (psi)
	Shaft End Pump	Cover End Pump		
PVE012	25 (1.54)	–	3000	210(3000)
PVE19	41 (2.50)	–	2400	210(3000)
PVE21	45 (2.75)	–	2400	186(2700)

* Shaded product may not be available

Pressure Limits

Port	Pressure Range
Inlet**	0,2 bar to 2,0 bar (5 in. Hg. vacuum to 30 psi)
Outlet	See Maximum Pressures listed above
Drain*	0,35 bar (5 psig) maximum

* Integral relief valve protects pump by limiting case pressure peaks to 0,7 bar (10 psi) above inlet pressure. Flow from valve returned directly to pump inlet. Case drain line required to limit steady-state case pressure.

** See page 9 for Inlet vs. Speed details.
For non-intergrated units only

Operating Data

Displacement Speed, and Pressure Ratings

At Full Flow Conditions

Displacement cm ³ /r (in ³ /r)	Inlet Pressure/Vacuum*	Maximum Speed** rpm
PVE21 full displacement 45 (2.75)	5 psig	2800
PVE19 full displacement 41 (2.50)	0 psig	2400
	5 in. Hg.	2100
	5 psig	3100
PVE19/21 destroyed 33 (2.00)	0 psig	2750
	5 in. Hg.	2500
	5 psig	3200
PVE19/21 destroyed 25 (1.50)	0 psig	3000
	5 in. Hg.	2850

PVE012 limited to 3000 rpm at full displacement and 0 psig inlet.

* Minimum pressure/vacuum required at pump inlet to operate at displacement and speed listed.

** Speeds not listed, but within displacements shown above, may be calculated from values listed.

At Load Sense Standby Condition – “B” Option Controls

Model Number System	Maximum Speed rpm
PVE012	3600
PVE19	3200
PVE21	3200

Pump must be in zero flow, low pressure, standby condition when operated at listed speed. Pump may be damaged if not slowed to normal rated speed before being operated at full flow.

Response Data

Control Type	PVE012		PVE19/21	
	On Stroke sec.	Off Stroke sec.	On Stroke sec.	Off Stroke sec.
Pressure compensator	0.030	0.012	0.050	0.025
Load sense compensator	0.040	0.012	0.060	0.020

Yoke response recorded at rated speed and pressure, 0 psi inlet, 82°C (180°F), SAE 10W oil. Pressure rise was 6900 bar (100,000 psi) per second.

Controls

PVE012

See installation dimensions page 10 for other details.

Adjustment

Loosen the locknut on the adjusting rod. Turn the adjusting rod clockwise to decrease maximum pump delivery, or counterclockwise to increase maximum pump delivery, until the desired setting is obtained. Secure the setting by tightening the locknut. To assist initial priming, the manual adjustment control setting must be at least 40% of the maximum flow position.

This control enables maximum pump delivery to be externally adjusted from 25% to 100% while maintaining all the standard features of a pressure compensated pump.

Controls

PVE19/21 Adjustable Maximum Displacement Stop

Adjustment

Loosen the locknut on the adjusting rod. Turn the adjusting rod clockwise to decrease maximum pump delivery, or counterclockwise to increase maximum pump delivery, until the desired setting is obtained. Secure the setting by tightening the locknut. To assist initial priming, the manual adjustment control setting must be at least 40% of the maximum flow position.

This control enables maximum pump delivery to be externally adjusted from 25% to 100% (it is not recommended below 50%) while maintaining all the standard features of a pressure compensated pump.

Controls

Load sensing compensator control port location for L.H. rotation

Compensator control port location for L.H. rotation

Controls

Unloading Valve Control – “E” Option

With the unloading valve control the variable pump will unload at a preset pressure. The pump will maintain this no flow, low pressure (approximately 14 bar (200 psi)) standby condition, until system pressure drops to about 85% of the preset unloading pressure. The pump will then return on stroke and provide full flow until the preset unloading pressure is reached again.

With this control, an efficient accumulator charging circuit is obtained. The pump will provide full flow to fill the accumulator until the maximum charging pressure is reached. The pump then goes to a standby condition until the accumulator pressure drops to 85% of the desired maximum. The accumulator is then recharged as the cycle starts over again.

A separate right angle check valve must be provided to maintain the accumulator hydraulic charge and prevent back flow when the pump is unloaded. The check valve's internal leakage must not exceed five drops per minute. The control port must be connected to system pressure, downstream of the check valve.

Adjustment range

PVE19	100-210 bar (1500-3000 psi)
PVE21	100-186 bar (1500-2700 psi)

Cut-in pressure is 85% of unloading pressure, minimum.

Setting Pressures

1. Back out accumulator unloading pressure adjustment screw to below desired unloading pressure.
2. Adjust desired standby pressure.
3. Set accumulator pressure by screwing in the accumulator unloading adjustment screw. Accumulator recharge (cut-in) pressure is a function of the maximum accumulator pressure and is not adjustable.
4. Check pressure settings and re-adjust if necessary.

Thru-drives

Thru-drive Pump Support Bracket

An optional support bracket should be used when a heavy second pump is mounted to a thru-drive PVE19/21. The support bracket (627179), two screws (199740), and two washers (427700) must be ordered separately.

Application Data

Fluid Cleanliness

Proper fluid condition is essential for long and satisfactory life of hydraulic components and systems. Hydraulic fluid must have the correct balance of cleanliness, materials, and additives for protection against wear of components, elevated viscosity, and inclusion of air. Fluid contamination levels according to ISO4406 should not exceed 21/18/13 for PVE Piston pumps.

Essential information on the correct methods for treating hydraulic fluid is included in Danfoss publication 561 "Danfoss Guide to Systemic Contamination Control" available from your local Danfoss distributor or by contacting Danfoss Hydraulics. Recommendations on filtration and the selection of products to control fluid condition are included in 561.

Recommended cleanliness levels, using petroleum oil under common conditions, are based on the highest fluid pressure levels in the system and are coded in the chart below. Fluids other than petroleum, severe service cycles, or temperature extremes are cause for adjustment of these cleanliness codes. See Danfoss publication 561 for exact details.

Danfoss products, as any components, will operate with apparent satisfaction in fluids with higher cleanliness codes than those described. Other manufacturers will often recommend levels above those specified. Experience has shown, however, that life of any hydraulic component is shortened in fluids with higher cleanliness codes than those listed below. These codes have been proven to provide a long, trouble-free service life for the products shown, regardless of the manufacturer.

Fire resistant fluids

Water glycol, phosphate ester and polyol ester fluids may be used with PVE pumps. With the PVE012 and PVE19, system pressure and input speed should not exceed 140 bar (2000 psi) and 1800 r/min.

System temperature should not exceed 54°C (130°F). Inlet vacuum should not exceed 101,6 millibar (3 in. Hg.).

Hydraulic fluids and temperature ranges

Use antiwear hydraulic oil, or automotive type crankcase oil designations SC, SD, SE or SF per SAE J183FEB80.

Select a viscosity grade that will allow optimum viscosity, between 40 cSt (180 SUS) and 16 cSt (80 SUS), to be achieved within the optimum performance envelope shown.

For further information, see Danfoss Hydraulic Hints and Trouble Shooting Guide.

Ordering procedure

Order PVE pumps by the full model designation. Pump displacement, mounting flange type, direction of rotation, pump configuration, shaft end type, seals, pressure adjustment range, specific control functions are all specified in the full model code.

Notes

Products we offer:

- Cartridge valves
- DCV directional control valves
- Electric converters
- Electric machines
- Electric motors
- Gear motors
- Gear pumps
- Hydraulic integrated circuits (HICs)

Danfoss Power Solutions is a global manufacturer and supplier of high-quality hydraulic and electric components. We specialize in providing state-of-the-art technology and solutions that excel in the harsh operating conditions of the mobile off-highway market as well as the marine sector. Building on our extensive applications expertise, we work closely with you to ensure exceptional performance for a broad range of applications. We help you and other customers around the world speed up system development, reduce costs and bring vehicles and vessels to market faster.

Danfoss Power Solutions – your strongest partner in mobile hydraulics and mobile electrification.

Go to www.danfoss.com for further product information.

We offer you expert worldwide support for ensuring the best possible solutions for outstanding performance. And with an extensive network of Global Service Partners, we also provide you with comprehensive global service for all of our components.
