# Design Features

## Specifications

Bore sizes: 40 to 320 mm  
Rod sizes: 25 to 220 mm  
Design Pressure: 25 Mpa (250 bar)  
Proof Pressure: 37.5 Mpa (375 bar)  
Maximum Rod Speed: 1.0m/s

### 1. Global Design

Engineered for ISO6022/DIN 24333 interchangeability with the durability required for heavy duty applications.

### 2. Heads and Cap

One piece round construction head and caps are manufactured from high strength material and precise machining with a pilot diameter to ensure accurate alignment with the cylinder bore. An integral bearing and seal design featuring heavy wear bands resists side loads. The wide separation of these wear bands reduces bearing stresses, and maximizes cylinder service.

### 3. Special Wearbands

Metal-to-metal contact is eliminated, providing superior wear ability, increased load carrying capability, and prolonged cylinder life.

### 4. Sure Seal Sealing System

Carefully selected wiper and seal combinations are mated with a hard chrome plated piston rod to deliver exceptional all-around performance and durability for rod sealing system. Normal sealing system uses a combination of double lip rod seal along with an o-ring energized PTFE seal and a double lip rod wiper. The high and low temperature rod sealing system uses one more PTFE seal instead of the lip seal to provide positive static and dynamic sealing at low and high pressures.

Piston sealing system offers a selection of highly efficient piston seal materials and wide wear bands that rides smoothly within the precision-honed cylinder body to provide extended piston seal life. The use of bi-directional piston seals eliminates trapped pressures.

### 5. Piston Rod

Hard chrome plated, case hardened rod in carbon or alloy steel are available to give maximum durability and flexibility depending on application. Heavier plating is available as a custom option, in addition to various types of stainless steel.

### 6. High strength Steel Tubing

High strength steel is used to insure long cylinder life.

### 7. Captive Screws

Inadvertent removal of cushion screws is prevented, while still allowing a full range of adjustment.

### 8. Fully Adjustable Cushioning System

This design has been engineered to provide the ability to tune the cushion performance for an optimized deceleration profile. Our patented floating ring cushion seal or an alternate ball check design allows maximum acceleration. This excellent acceleration profile translates into faster cycle times and increased machine production.

The floating cushion sleeve permits very close seal contact without high loading. The sleeve seals against the cap and provides a very effective seal to trap the fluid. The sleeve is also free to move in axial direction and functions as a fluid check, which permits nearly full flow for quick acceleration.

### 9. Threaded Body Flanges

The threaded steel flange design has superior bending stress capacity, durability, and increased safety factors of shear over similar welded flange type designs.

High strength bolts are used for assembly with hardened steel washers to guarantee failure free performance.

### 10. Acceptance Test

Hydraulic cylinders are tested in accordance with ISO 10100:2001, Hydraulic fluid power — Cylinders — Acceptance tests.

# How To Order

## Standard Cylinders

Vickers by Danfoss has created an easy system for ordering IM25 series hydraulic heavy duty cylinders. This system has been developed to improve our service to you. The model code consists of 29 alpha-numeric digits which fully describe the most common standard options offered on IM25 series cylinders. To specify your series IM25 series cylinder, review the following pages for full description of each option available and select the desired code.

This model code system will:

- **Simplify the re-order process**  
Each Vickers by Danfoss cylinder is assigned a 29 digit model code. That code is unique to particular cylinder description. That way, when you re-order your IM25 Series cylinder, you are assured of exactly the same top quality cylinder design.
- **Improve identification**  
Every cylinder has its 29 digit model code clearly marked on the product. Each 29 digit code completely describes a specific cylinder. This allows seal and replacement components to be easily identified in the field.
- **Facilitate communications**  
This fully descriptive model code system allows you to work directly with your local sales engineer to identify and service your cylinder.

**NOTE: See page 6 for a summary of model code options.**

## Custom Cylinders New Cylinders

Although the model code has been arranged to cover the vast majority of available options, there will be occasions when you require an option which cannot be coded. When specifying such an option, enter a "X" for the appropriate item in the 29 digit model code, and then describe your requirements. For example, if you have an application which requires a custom thread on the end of the piston rod, enter an "X" for item 24. Then add a full description at the end of the model code, such as "With 50mm total rod projection and M22 x 1.5 thread 30mm long." Or if you have an application which requires options like Transducer and Rod boot, enter "X" for item 30. Then add a full description at the end of the model code, such as "Transducer and Rod boot". The cylinder will then be given a unique design number on the receipt of order (as explained in the next section.)

## Replacement Cylinders

Every custom cylinder is assigned a unique identification number. When ordering a replacement cylinder, simply give the 29 digit model code or the unique identification number to your local Cylinder Sales representative.

## Replacement Parts

Each identification number is stored in quick retrieval computerized storage system. This gives our field sales representatives rapid access to assist you in identifying and specifying genuine Danfoss replacement parts.

## How to use information and select cylinder in this catalog

Step 1: Find the Piston and Annulus area for the application  $A_B$ , Piston area = Push Load/Pressure,  $A_A$ , Annulus area = Pull Load/Pressure  
Note: Max pressure allowable is 25 Mpa (250 bar)

Step 2: Select the bore & rod combination from page 31 which will have areas greater or equal to  $A_B$  and  $A_A$  respectively

Step 3: Select the required mounting for the application refer page 29 for mounting types and selection guide

Step 4: Maximum allowable extended length for pushing application should be checked from buckling chart on page 33 for the selected bore, rod and stroke combination. If selected combination is not safe next higher size rod diameter is recommended (Repeat steps 1 to 4 for the new selection)

Step 5: Select the appropriate sealing system, refer to page 18 for seal selection guide

Step 6: If the application demands cushion at end of stroke refer to the cushion calculation details on page 35

Step 7: Select the required port, refer to page 20 port selection. To check if the port and cushion position selected is feasible, refer to page 22

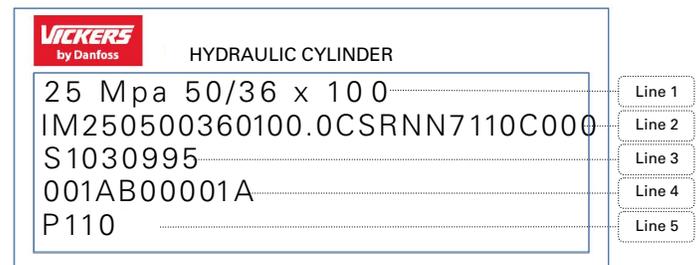

Step 8: If the application demands position sensor refer to transducer section on page 23 to help select correct transducer and respective mounting dimensions

Step 9: Refer to mounting accessories section on page 14 to select the respective accessories

Step 10: Refer the model code section on page 6 to help you code the cylinder per the selected parameters. For any custom options a clear description to be included with the model code

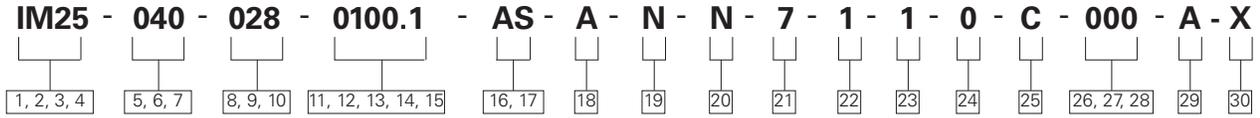

**Note: Application data sheet should be filled and sent to sales representative to help you select correct cylinder configuration.**

## Cylinder Identification Plate

Line 1: Cylinder Pressure Rating Bore/Rod x Stroke  
Line 2: Unit Part Number (29 Digit Model Code) without "-"  
Line 3: OA number or Sale order number  
Line 4: Unique design number  
Line 5: Plant and Date code

# Common Options

## Sealing System Selection

Three different sealing systems are available in IM25 series, determine the correct seal code for your application, and then enter it in the model code.

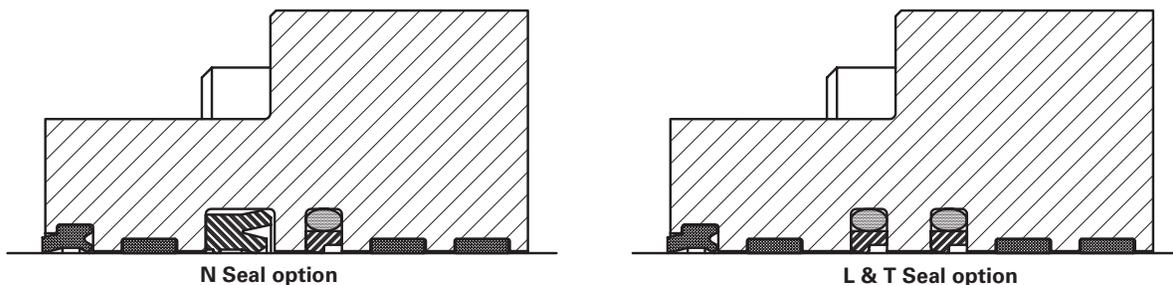

Sealing system combination	Rod seal system code	Piston sealing system code	Temperature range °C	Max. Speed m/s	Application
N-Normal	Normal	Normal	-30 to 60	0.5	Normal, typical industrial
L-Low friction	Low friction	Low friction	-30 to 60	1.0	Low friction servo
T-High temperature*	High temperature	High temperature	-10 to 80	1.0	High temperature

## Sealing System Details

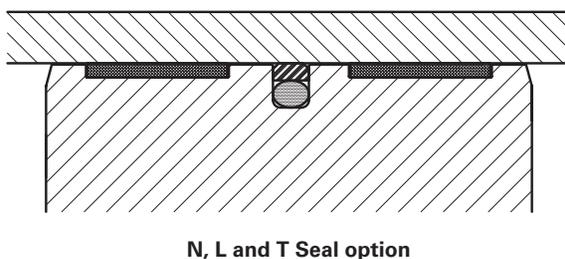

Sealing system	Rod seal system	Piston sealing system	Fluid compatibility
N-Normal	Wiper (1) Double lip rod seal (Polyurethane) (1) O-ring (Nitrile) energized PTFE seal (1) Wearbands	Bi-directional O-ring (Nitrile) energized PTFE seal (1) Wearbands	Mineral Oil Mineral based fluid Petroleum based fluid Water in oil emulsion Water glycol (Max 40°C)
L-Low friction	Wiper (1) O-ring energized (Nitrile) PTFE seal (2) Wearbands	Bi-directional O-ring (Nitrile) energized PTFE seal (1) Wearbands	Mineral Oil Mineral based fluid Petroleum based fluid Water in oil emulsion Water glycol (Max 40°C)
T-High temperature*	Wiper (1) O-ring (Fluorocarbon) energized PTFE seal (2) Wearbands	Bi-directional O-ring (Fluorocarbon) energized PTFE seal (1) Wearbands	Mineral Oil Mineral based fluid Petroleum based fluid

\*The high temperature seals function up to 200°C but the wear band strength reduces accordingly.

## Port and Cushion Location

Port and cushion locations are identified by viewing the cylinder from the head end (or from the mounting end of double rod cylinder). The location numbers are shown to the right. Certain port and cushion locations cannot be specified with some mounting styles. The table below indicates which of the head and cap port and cushion locations are available for IM25 Series all mounting style.

## Port location availability chart

Mounting Style Code	Description	Head location				Cap location

# Common Options (Continued...)

## Position Feedback System

Danfoss has been an industry pioneer incorporating positioning systems into industrial cylinder. Two types of feedback systems are available

- End of stroke indicators like proximity switches
- Absolute position indicators like linear transducers

## Switch details

Maximum Pressure	50 Mpa
Ambient temperature	-25°C to +80°C
Rated operational voltage	24 Vdc
Voltage drop static	<=1.5 Vdc
Rated operational current	200 mA
Degree of protection	IP68 per BWN Pr 20
Switching output	PNP
Switching element function	NO
Hysteresis	<15%
Ripple of power supply	15%
No load current	10mA
Supply voltage max	30 Vdc
Supply voltage min	10 Vdc
Voltage drop static	<=2 Vdc
Operating frequency	1000 Hz

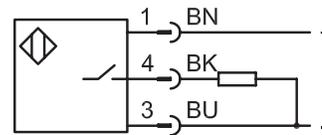

## Switch envelope details

Bore (mm)	PH (mm) (Approx)	PC (mm) (Approx)
40	86	75
50	90	78
63	95	81
80	102	110
100	108	110
125	142	155
140	150	162
160	155	162
180	162	162
200	170	170
220	225	225
250	235	235
280	250	250
320	260	260

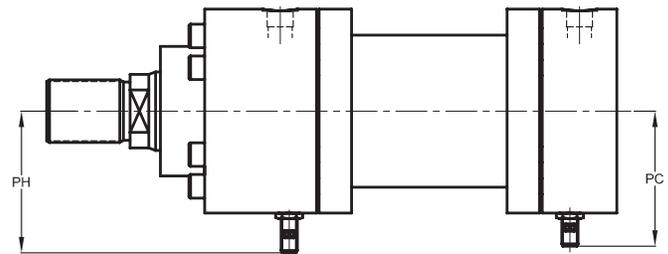

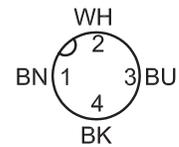

## Proximity Switch Option

Proximity switches for Series IM25 Cylinder are inductive type switches with a sensing probe that looks at the cushion collar or cushion spud to provide extend or retract indication. These switches are non contact type and are designed with probe inside the cylinder to protect against wear resistance and harsh external environments. Switch is also protected against short circuit and polarity reversal.

Wiring diagram

Pinout diagram

## Common Options (Continued...)

### Linear Transducer Option

A complete line of precision cylinder position sensing and feedback devices are available. These packaged cylinder systems can handle virtually any application requiring feedback through out the cylinder stroke with or without velocity monitoring.

Series IM 25 Cylinder utilizes feedback technology based on magnetostriction principle. Danfoss can supply cylinder prepared for transducer or with transducer. Various cover options are also available to protect transducer from external harsh environment.

### Transducer Details

Operating Principle	Magnetostrictive position sensing
Operating Pressure	250 Bar
Operating temperature (sensor electronics)	-40 to 75°C
Cable length	5m (15ft) standard *

### Analogue Output option

Input Voltage	+24 Vdc (20.4-28.8 Vdc) standard
Output (Voltage)	0-10 Vdc (standard) *
Output (current)	4-20mA (standard) *
Resolution	Infinite
Non-Linearity	$\pm 0.02\%$ or $\pm 0.05$ mm ( $\pm 0.002$ in.), whichever is greater
Repeatability	$\pm 0.001\%$ of full stroke or $\pm 0.0001$ in. ( $\pm 0.0025$ mm), whichever is greater.
Measuring Range (Sensor only)	50mm to 2540mm (2 to 100 in) *
Protection (sensor)	IP 67
Connection Type on sensor	6 pin male (see details)

### Digital Output option

Input Voltage	+24 Vdc Nominal (-15 or +20%)
Output	SSI
Resolution	5 $\mu$ m
Data length	24 Bit
Output format	Gray
Measuring direction	Forward
Non-Linearity	$< \pm 0.01\%$ F.S. (minimum $\pm 40$ $\mu$ m)
Repeatability	$< \pm 0.001\%$ F.S. (minimum $\pm 2.5$ $\mu$ m)
Hysteresis	$< 4$ $\mu$ m typical 2 $\mu$ m
Measuring Range (Sensor only)	50 - 7620 mm
Protection (sensor)	IP 67
Connection Type on sensor	7 pin male (see details)

\* For other options consult factory

## Transducer connector pin details

Standard transducer comes with 6/7 pin male connector (depending on output) with a 5m length cable with female connector connected to it.

### 6 Pin connector for Analogue output

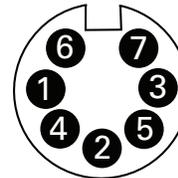

Pin No.	Wire Color	Function Analog Output
1	Grey	0 to 10, -10 to +10 Vdc or 4 to 20 mA, 0 to 20 mA or reverse acting: 10 to 0, 10 to -10 Vdc or 20 to 4 mA, 20 to 0 mA
2	Pink	Return for pin 1
3	Yellow	Programming (RS-485+)
4	Green	Programming (RS-485-)
5	Red or Brown	Supply voltage (+Vdc)
6	White	DC Ground (for supply)

Integral D6 connector (male)  
as viewed from end of sensor

### 7 Pin connector for Digital output

Pin No.	Wire Color	Function Analog Output
1	Grey	Data(-)
2	Pink	Data(+)
3	Yellow	Clock(+)
4	Green	Clock(-)
5	Brown	+24 Vdc
6	White	0 V (GND)
7	n.c	

Male connector pin-out as  
viewed from the end of the  
sensor

## Types of covers

Standard cover for transducer is aluminum casing for all mount except for MP5 & MP3 where the transducer is enclosed in body.

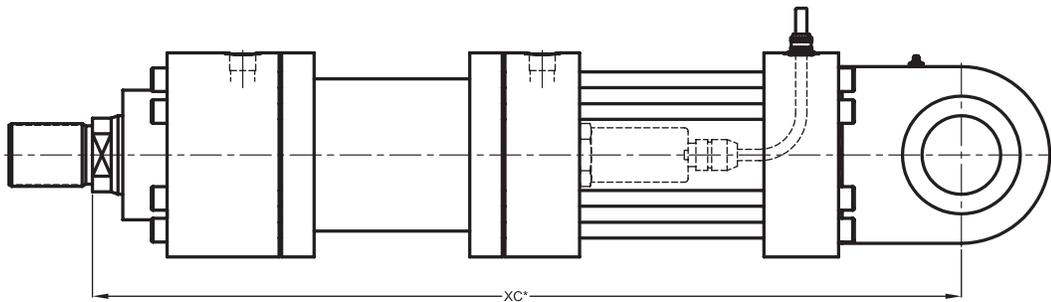

**\*Note: Transducer cover option not available for 50 & 63 Bore cylinders for MF4 mount**

MS2

## Common Options

(Continued...)

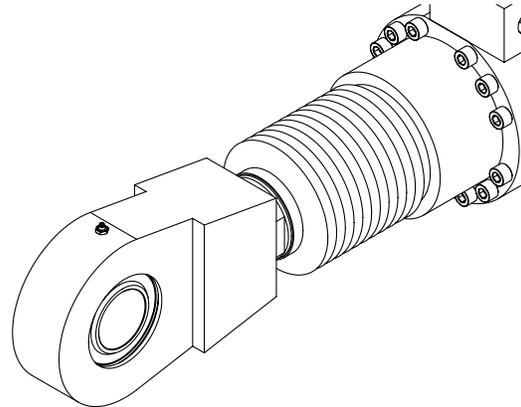

### Other Options

#### Special Rod Ends

Modifications of standard rod ends or completely special rod end styles are available to meet unique rod end connection requirements.

#### Rod Boots

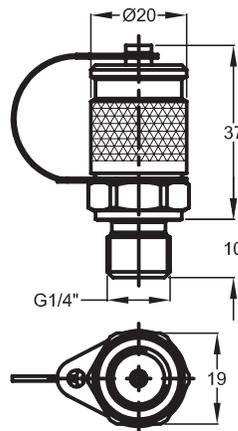

A rod boot surrounds the piston rod with an external, expandable cover to protect the rod surface from external contamination. This option requires additional rod length which is determined by the cylinder stroke.

#### Test Coupling

Test couplings are available as option which can be used for air bleeding and pressure measurement.

Usually cylinders will bleed themselves of air when ports are vertical, on top. Bleed ports are often desirable to remove entrapped air, when the ports are on the bottom. High performance and high speed or heavy load applications are a few examples where air bleeds desirable.

#### Gland Drain

Gland drains are primarily used for long stroke cylinders (over 800mm) and when extended speed exceeds retract speed. The gland drain is used to return any accumulated fluid, between the rod seal and wiper to tank. This is used in servo applications, for ultralow leakage requirements, or for remote visual monitoring seal leakage for preventive maintenance purposes.

#### Special Coating and painting

Cylinders can be prepared with a primer coat, epoxy, lacquer or enamel paint finish coatings to customer specifications. Synergistic, Nitro carburizing and other material treatments are also available for special applications.

#### Extra Heavy Chrome Tubes and Rods

Added wear and corrosion resistance are available by specifying Extra Heavy Chrome (.05 to .07 mm thick).

#### Special Cylinders

For special cylinder out of this catalog range, Danfoss' engineering and design team is ready to produce special designs to meet customer's requirements. Contact your Danfoss sales representative for any special requirements like special mounting, special seals, special bore diameter, special piston rod diameter, special pressure requirements etc., use the application data sheet to help us design cylinder to match your application.

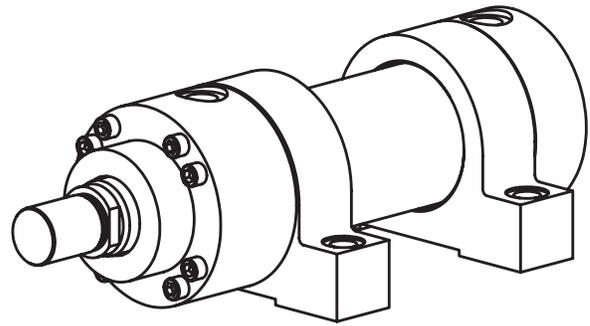

# Application/Engineering Data

## Mounting Types and Application Guide

### AS: Side Lug (MS2)

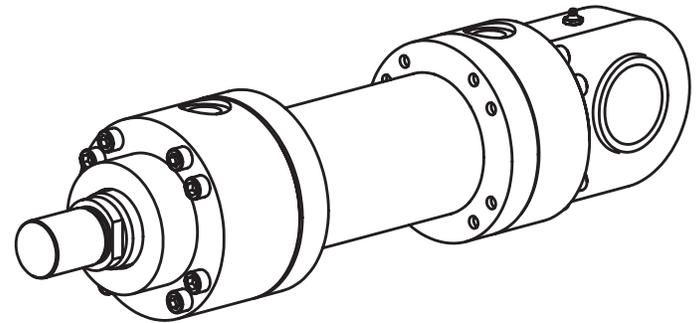

Side Lug Mounting styles are for moving loads along a flat guided surface, as in a carriage along rails. The mounting surface should be flat and parallel to the center line of the piston rod. The load should be guided to traverse along the center line of the piston rod. With unsupported loads, the bearing must absorb more force. For these applications, the larger alternate rod is recommended and stop tubes should be considered.

The frame on which the cylinder is mounted must be sufficiently rigid to resist the bending moments. Use high tensile socket head cap screws or hex head bolts tightened to the manufacturers recommended torque. The mounting bolts should not be subjected to shear load, use of keys is recommended.

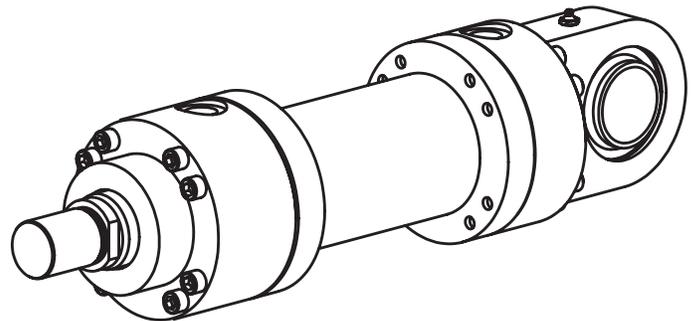

### CM: Cap Fixed Plain Eye (MP3)

This mounting style is for applications in which the machine member travels in a curved path within one plane. This mount can be used both in compression (push) and tension (pull). The centerline of the machine member that attaches to the swivel pin must be perpendicular to the centerline of the piston rod and the curved path must be in one plane only. Any misalignment will cause excess side loading on bearings and lead to premature failure.

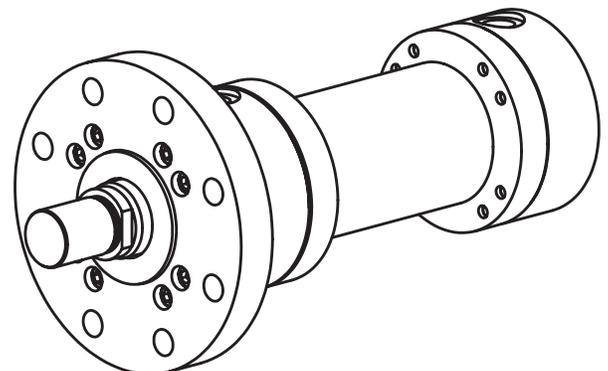

### CS: Cap Fixed Eye with Spherical Bearing (MP5)

This mounting style is for applications in which the machine member travels in a curved path in one plane where some misalignment is unavoidable. This mount can be used both in compression (push) and tension (pull). Refer to the allowable tilt angle in the dimension section of this mounting.

### FS: Head Circular Flange (MF3)

This mounting style is ideal for straight line force transfer applications in which the cylinder is used in tension (pulling). The mounting surface should be flat, and the rod end should be piloted into it. The force of the load should be perpendicular to the piston rod. The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments. Use high tensile socket head cap screws or hex head bolts tightened to the manufacturers recommended torque.

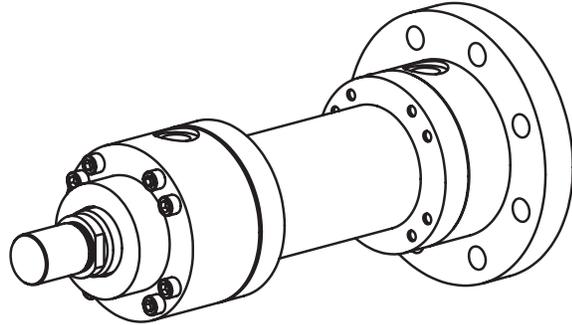

## Application/Engineering

### Data (Continued...)

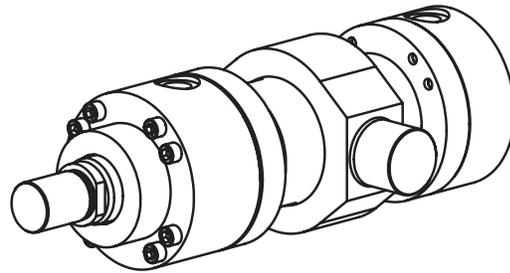

#### RS: Cap Circular Flange (MF4)

This mounting style is ideal for straight line force transfer applications in which the cylinder is used in compression (pushing). The mounting surface should be flat, and the flange should be piloted into it. The force of the load should be perpendicular to the piston rod. The frame on which the cylinder is mounted must be sufficiently rigid to resist bending moments. Use high tensile socket head cap screws or hex head bolts tightened to the manufacturer's recommended torque.

#### TT: Intermediate Trunnion (MT4)

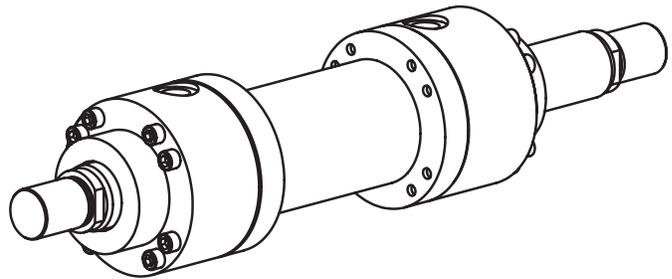

The Intermediate Trunnion Mounting style is for longer stroke applications in which the machine member travels in a curved path in one plane. On special orders the trunnion can be located anywhere along the body. This mounting can be used both in compression (push) and tension (pull) applications. It is recommended that rigidly mounted trunnion mount blocks with bearings at least as long as the trunnion pins be used and be installed close to the shoulder of the trunnion.

#### AD, FD and TD: Double rod Side Lug, Head Circular & Trunnion

Double end cylinders are specified when equal displacement is desired on both sides of the piston or when the application is such that another function can be performed simultaneously with a second rod. The single rod mount application data is applicable for all double head cylinders.

**Note: For pushing applications always check for buckling, refer to page 33 for detail**

# Application/Engineering Data (Continued...)

## Force and Area of Cylinder

To choose the proper size of cylinder for your application, first determine the maximum push and/or pull force required to do the job. Then use the table below to select the cylinder that will provide that force. Remember that force capabilities derived from charts and formulas may be theoretically correct, but other factors must be considered. Be sure to allow for pressure drop between the pump outlet and the cylinder port. Also, some of a cylinder's force is used up overcoming seal friction and, to a

lesser extent, the inertia of the piston itself. In Vickers by Danfoss cylinders, the amount of extra force needed to compensate for these factors has been limited to 5% or less of the cylinder's theoretical power without sacrificing sealing performance. For maximum reliability and fatigue life of the piston rod, the largest rod offered in a given bore size should be specified. The smaller rods for a given bore are primarily intended for short stroke push loading or reduced pressure applications.

Bore	Rod	Piston Area A <sub>B</sub>	Rod Area A <sub>R</sub>	Annulus Area A <sub>A</sub>	Push Force at 25 Mpa	Diff. Force at 25 Mpa	Pull Force at 25 Mpa	Flow at 0.1 m/s Out	Flow at 0.1 m/s Diff.	In

## Buckling Chart

In push applications a cylinder acts as a loaded column. There are three basic ways to mount the cylinders as shown which changes the end condition C to 2, 1 or 0.25. Select your mounting style and locate the column which is closed to but not below your applications operating pressure. The intersection of operating

pressure and bore/rod size represents the maximum allowable length (including stroke, rod accessories and extra rod projection) in push stroke. This maximum length is based on column loading and does not consider side loading, stop tube requirement or other cylinder stroke limiters. For pressure above 250 Mpa (25 Mpa) consult factory

### Maximum allowable length L (mm) at working pressure

The maximum allowable lengths are calculated using below formulae

1. Calculation per Euler

$$P = \frac{C\pi^2 EI}{FL^2} \text{ if } \frac{L}{k} > \sqrt{\frac{2C\pi^2 E}{S_y}}$$

2. Calculation per JB Johnson

$$P = \frac{ASy}{F} \left[ 1 - \frac{SyL^2}{4C\pi^2 Ek^2} \right] \text{ if } \frac{L}{k} \leq \sqrt{\frac{2C\pi^2 E}{S_y}}$$

- F** Safety factor, 3.5
- P** Critical load, N
- E** Modulus of elasticity, 2.1x10<sup>5</sup> Mpa
- L** Length, mm
- I** Moment of inertia, mm<sup>4</sup>
- C** End condition, refer respective mounting
- A** Rod area, mm<sup>2</sup>
- k** Radius of gyration, mm
- Sy** Yield strength of material, Mpa

# Application/Engineering

## Data (Continued...)

### Cushioning System

Cylinder cushions are designed to decelerate the piston velocity near the end of each cylinder stroke to prevent excessive mechanical shock. Danfoss' advanced cushions permit higher cylinder speed, shorter cycle time and more work per hour

Cushions are recommended when the piston makes full stroke and any of the below condition

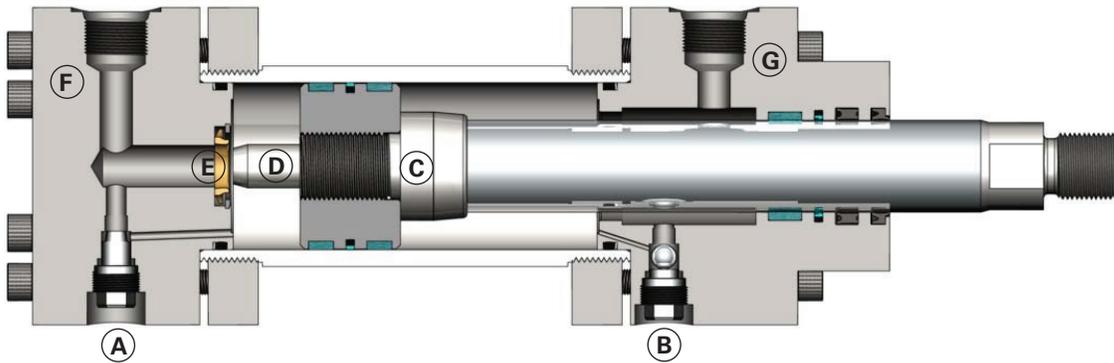

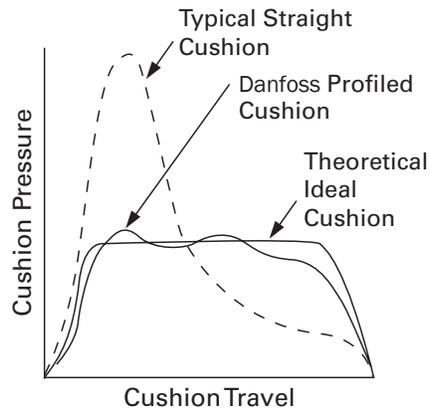

- Piston speed exceeds 0.13m/s
- Lower speeds with high masses connected to rod

### Cushion Features

- Check valve at head and floating sleeve at cap provides rapid acceleration out of the cushion.
- The floating design of collar and sleeve self aligns to minimize wear.
- Cushion adjustment screws are provided to tune cushion performance within limits

IM25 series hydraulic cylinders are available with optional cushions at head and cap. Head end cushion is accomplished by a self centering collar and the cap end cushion by a spud which is integral part of the piston rod.

Cushion collar contacts the cushion bore in head to create a seal and trap the fluid, similarly Cushion spud contacts floating sleeve at cap end and the sleeve seats against the cap to create seal and trap the fluid.

## Key assumptions and limitations

These assumptions provide parameters for determining maximum cushion performance. Actual performance may be different than determined by these methods, particularly if assumptions are not maintained.

Efficiency factors are applied to the energy calculations that attempt to reflect characteristics of Danfoss' cushion design.

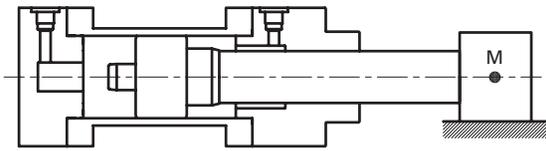

The following assumptions should be considered when calculating cushion capacity:

- Maximum cushion pressure is 375 bar
- The upper limit of velocity is 0.5 m/s
- If velocity is below 0.13 m/s, the cushions become ineffective on cylinders smaller than 80 mm bore

- Friction force is assumed to be zero
- The cylinder is used in a linear system (not for rotary applications)
- Fluid viscosity is equivalent to 25 centistokes
- The driving pressure is equal to the maximum system pressure, usually the relief valve setting
- Cushion adjustment screws are provided to tune cushion performance within limits
- Cushion efficiency (Ceff) is 0.67 for velocities between 0.1 and 0.3 m/s., or 0.5 for velocities between 0.3 and 0.5 m/s

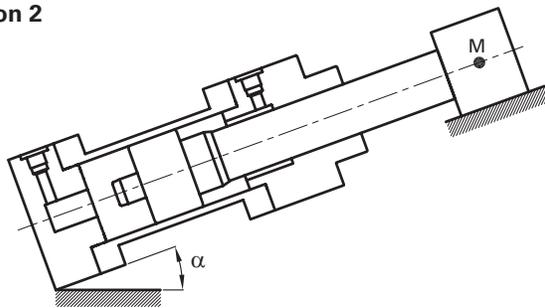

*If the energy absorption is more than the values indicated in the cushion curves then it should be absorbed by external means such as shock absorbers or springs.*

### Application 1

Extend or Retract  
 $E = (1/C_{eff}) [0.5 M V^2]$

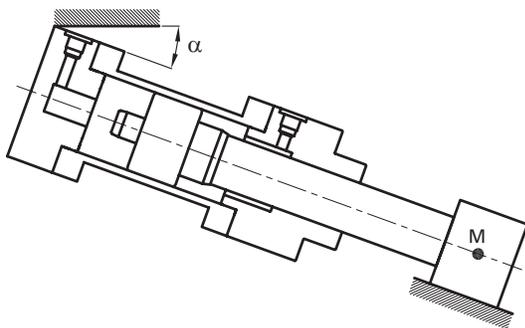

### Application 2

Extend  
 $E = (1/C_{eff}) \{ [0.5 M V^2] - [9.81 M (L_{hc}/1000 \sin(\alpha))] \}$

Retract  
 $E = (1/C_{eff}) \{ [0.5 M V^2] + [9.81 M (L_{cc}/1000 \sin(\alpha))] \}$

### Application 3

Extend  
 $E = (1/C_{eff}) \{ [0.5 M V^2] + [9.81 M (L_{hc}/1000 \sin(\alpha))] \}$

Retract  
 $E = (1/C_{eff}) \{ [0.5 M V^2] - [9.81 M (L_{cc}/1000 \sin(\alpha))] \}$

# Application/Engineering Data (Continued...)

## Units

E	Energy	Joule
M	Mass	Kg
V	Velocity	m/s
Pd	Driving pressure	Bar
Lhc	Head cushion length	Mm
Lcc	Cap cushion length	Mm
g	Gravity constant	9.81/1000

### Steps to find the cushioning capacity

- Calculate the Energy per the applicable formulae (Application 1, 2 or 3)
- Select the applicable Cushion Chart
- Plot a point with Energy on Y axis and Driving pressure along X axis
- Plotted point should be below the cushion curve for select bore & rod combination

### Example 1

IM25 cylinder in application 3 and extending:

Using a IM25 cylinder with a 100 mm bore, 63 mm rod is mounted at a 45° angle from horizontal with rod down. A 1300 kg mass is attached to the rod and system pressure is 100 bar. The cylinder is moving the mass at 0,3 m/s.

Using the calculation for application 3:

$$E = (1/C_{eff}) \{ [0.5 M V^2] + [9.81 M (L_{hc}/1000 \sin(\alpha))] \}$$

$$E = (1/0.67) \{ [0.5 * 1300 * 0.3^2] + [9.81 * 1300 * (55/1000) * \sin(45)] \}$$

$$E = 828 \text{ Nm (joule)}$$

Pick the chart (see page 38) for IM25 cylinder, rod extending. The curve is for the 100 bore.

Enter the vertical axis at 828 Nm and the horizontal axis at 10 Mpa (100 bar). The point of intersection is below the 100 curve so the cushion is acceptable. The maximum allowable pressure on the cap end is 164 bar which is greater than the specified system pressure of 100 bar.

### Example 2

IM25 cylinder in application 2 and retracting:

Using an IM25 cylinder with a 100 mm bore; 63 mm rod is mounted at a 45° angle from horizontal with rod up. A 1300 kg mass is attached to the rod and system pressure is 250 bar. The cylinder is moving the mass at 0.3 m/s.

Using the calculation for application 2:

$$E = (1/C_{eff}) \{ [0.5 M V^2] + [9.81 M (L_{cc}/1000 \sin(\alpha))] \}$$

$$E = (1/0.67) \{ [0.5 * 1300 * 0.3^2] + [9.81 * 1300 * (34/1000) * \sin(45)] \}$$

$$E = 545 \text{ Nm (joule)}$$

Pick the chart (see page 37) for IM25 cylinder, rod 1 retracting.

The curve is for the 100 bore 63 rod. Enter the vertical axis at 545 Nm and the horizontal axis at 25 Mpa (250 bar). The point of intersection is below the 100-63 curve so the cushion is acceptable.

### Manifolds and Valves

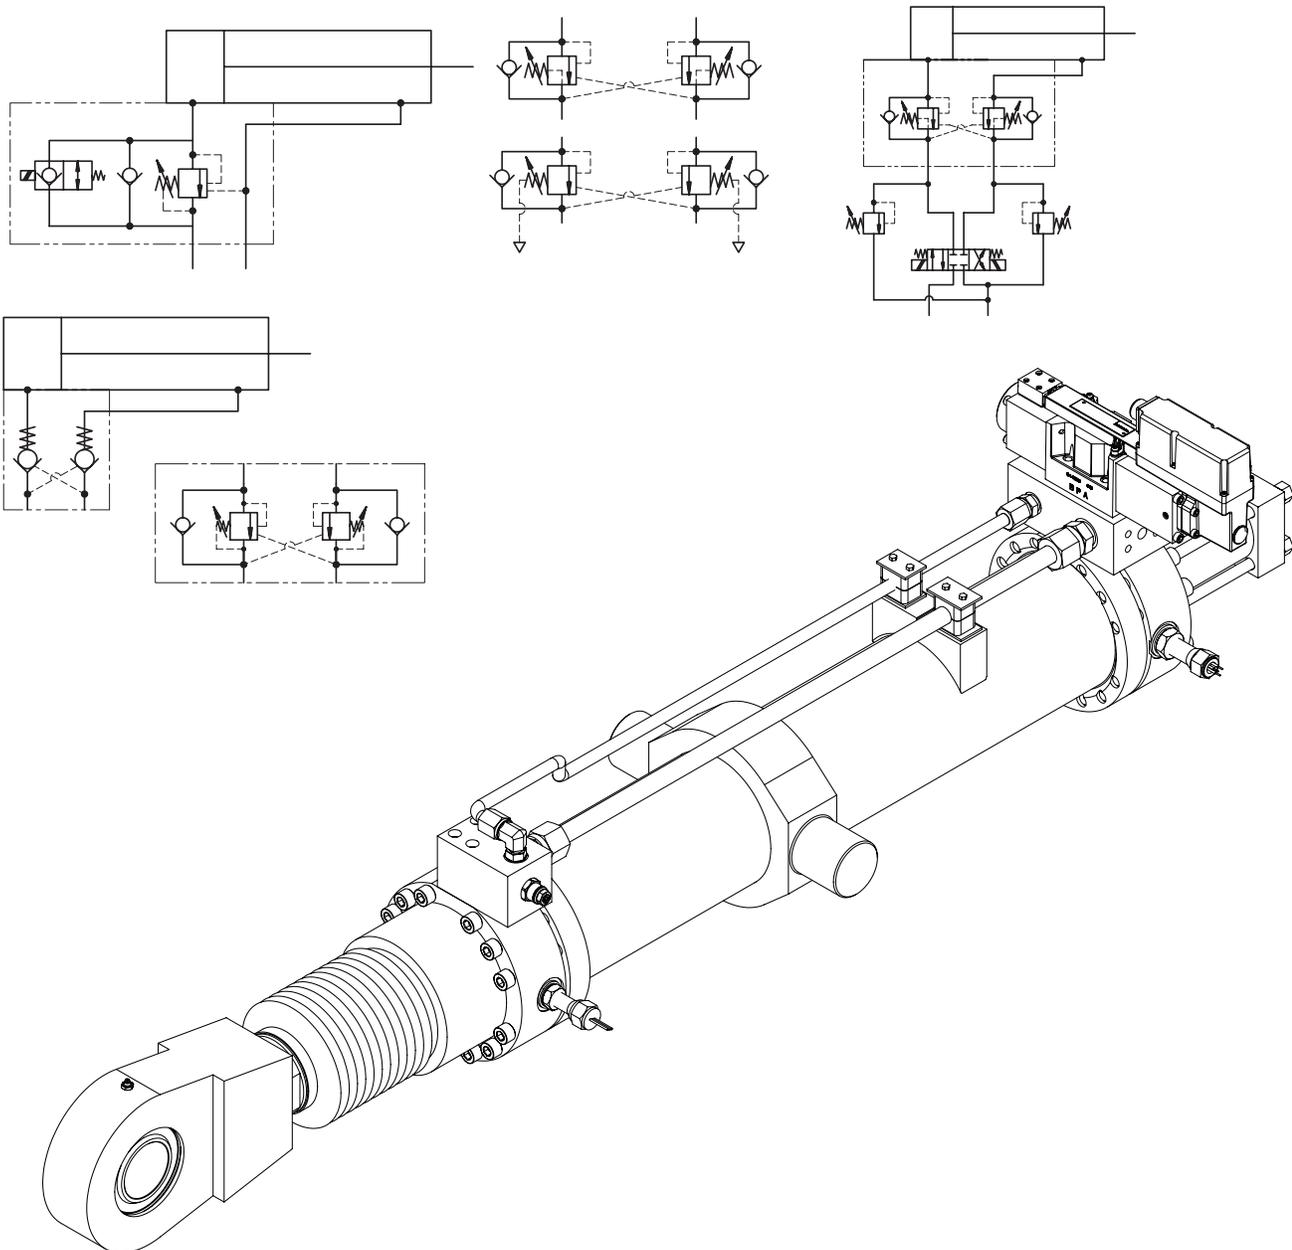

Danfoss can supply cylinders integrated with Integrated Hydraulics cartridge valves and manifolds.

Part Balanced Over centre Valves: Designed to be used in conjunction with closed centre directional valves. This type of over centre remains open as a relief valve when there is back pressure on the valve port.

- Emergency Lowering: By using a two-positioned, two ported solenoid valve mounted in or onto the cylinder, a bypass for the load holding valve is achieved.

- Line Mounted Valves: Hose failure can result in dangerous load conditions, so line mounted over centre or pilot operated check are not recommended.
- Gasket Mounted Valves: Valves mounted onto a gasket face with an 'O' ring seal between the faces.
- Banjo Mounted Valves: For use with standard cylinders where the only available mounting is the threaded port.
- Cylinder Mounted Valves: The best option is to mount the cartridge into the cylinder end, reducing pipe work and removing gasket seals.

### Typical application with valves installed on cylinder

### Single Rod End:

For IM25-100-063-0100.0-CS-R-N-N-7-7-0-C-000

The mounting is cap fixed eye with spherical bearing, Ø100mm bore and Ø63mm rod, the weight of the cylinder at zero stroke is 55 kg. For 100mm stroke additional weight is 5.2kg. Total weight of the cylinder will be 55 + 5.2 = 60.2kg

### Double Rod End:

For IM25-100-063-0100.0-TD-R-N-N-7-7-0-C-000

The mounting is trunnion mount with double rod, Ø100mm bore and Ø63mm rod, the weight of the cylinder at zero stroke is 66 kg. For 100mm stroke additional weight is 5.2kg. Total weight of the cylinder will be 66 + 7.7 = 73.7kg
