## Solenoid valves for water shut off and leak detection

### Types EV220T, EV220W, EV220B, and EV228B

Solenoid valve range for water leak detection in residential and industrial buildings:

- Houses and apartments
  - Kitchen and bathrooms
- Commercial buildings
- Industrial buildings

Solenoid valves used for shut-off water supply to prevent water damages from leaking systems.

#### Features and versions

- Clip-on coil
- Flow range for water in Kv: 0.7 - 40 m<sup>3</sup> / h
- Differential pressure: 0.3 – 16 bar
- Media temperature from 0 – 120 °C
- Ambient temperature: up to 80 °C
- Coil enclosure: IP65
- Thread connections: From G 3/8 – G 2
- DN 6 – 50
- Water hammer damped
- Built-in filter
- Adjustable closing time available
- EV220T 14-18, NC, polymer
- EV220W 10-22, NC, brass
- EV220B 6-12, NO, brass and DZR brass
- EV220B 6-12, NC, brass
- EV220B 15-50, NO, brass and DZR brass
- EV220B 15-50, NC, brass
- EV228B 15-25, UN (Latching), DZR Brass

- <sup>1)</sup> It is recommended to install a filter in front of the valve.  
<sup>2)</sup> In water applications, exercise the valves at least once every 24 hours, meaning change the state of the valve.  
 The valve exercise will minimize the risk of the valve sticking due to calcium carbonate, zinc or iron oxide build-up.

**Coil voltage disconnected**

When voltage is disconnected, the armature spring (2) presses the armature (3) down against the pilot orifice (4). Pressure builds up over the diaphragm (5) via the equalizing orifice (6). The diaphragm closes the main orifice (7) as soon as the pressure over the diaphragm equals the inlet pressure. The valve stays closed for as long as voltage remains disconnected.

**Coil voltage connected (open)**

When voltage is applied to the coil (1), the pilot orifice (4) is opened. Since the pilot orifice is larger than the equalizing orifice (6), pressure over the diaphragm (5) falls and the diaphragm is lifted clear of the main orifice (7). The valve stays open for as long as the required minimum differential pressure is present and voltage is applied to the coil.

**Coil voltage disconnected (closed):**

When the supply voltage to the coil (8) is disconnected, the valve plate (3) is pressed down against the pilot orifice (6) by the armature spring (1). The pressure across the diaphragm (7) is built up via the equalizing orifice (4). The diaphragm closes the main orifice (5) as soon as the pressure across the diaphragm is equivalent to the inlet pressure. The valve will be closed for as long as the voltage to the coil is disconnected.

**Coil voltage connected (open):**

When voltage is applied to the coil, the pilot orifice (6) is opened. As the pilot orifice is larger than the equalizing orifice (4), the pressure across the diaphragm (7) drops and therefore it is lifted clear of the main orifice (5). The valve is now open and will be open for as long as the minimum differential pressure across the valve is maintained, and for as long as there is voltage to the coil.

**Coil voltage disconnected (closed):**

When the voltage to the coil (2) is disconnected, the pilot orifice (4) is open. As the pilot orifice is larger than the equalizing orifice (7), the pressure across the diaphragm (5) drops and therefore it is lifted clear of the main orifice (6). The valve will be open for as long as the minimum differential pressure across the valve is maintained, and for as long as the voltage to the coil is disconnected.

**Coil voltage connected (open):**

When voltage is applied to the coil, the valve plate (3) is pressed down against the pilot orifice (4). The pressure across the diaphragm (5) is built up via the equalizing orifice (7). The diaphragm closes the main orifice (6) as soon as the pressure across the diaphragm is equivalent to the inlet pressure. The valve will be closed for as long as there is voltage to the coil.

<sup>1)</sup> It is recommended to install a filter in front of the valve.

<sup>2)</sup> In water applications, exercise the valves at least once every 24 hours, meaning change the state of the valve.

The valve exercise will minimize the risk of the valve sticking due to calcium carbonate, zinc or iron oxide build-up.

**Switching poles**

When **+** (plus) is supplied to the right terminal pin and **-** (minus) to the left (see fig. b), the pilot orifice (4) is opened. As the pilot orifice is larger than the equalizing orifice (7), the pressure across the diaphragm (5) drops and therefore it is lifted clear of the main orifice (6). EEC electronic coil controller for solenoid valves, type EV220B.

The EEC gives the coil a short over-boost, and controls the armature speed:

- Low power consumption (holding power: 4 W)
- Reduced noise during operation
- Increased MOPD compared to standard coils
- Increased lifetime of the solenoid valve
- Enclosure:
  - IP67 version
- In accordance with:
