

Data sheet

Contactors Types CI 61 - 98

Contactors CI 61, CI 73, CI 86 and CI 98 switch powers of up to 30 kW, 37 kW, 45 kW and 55 kW respectively under $3 \times 380 \text{ V AC-3}$ loads.

Accessories include a wide selection of auxiliary contacts, mechanical interlocks and RC elements. Auxiliary contacts for mounting on the side or top are available. The auxiliary contacts have force-actuated contacts and can form part of safety switching.

Contactor, types CI 61 - 98

Contactor, types CI 61 - 98

Description

Thermal overload relays TI 80-86 are used with contactors type CI 61, CI 73 and CI 86 to give overload protection of squirrel-cage motors of 30 kW to 55 kW.

The relays trip under asymmetric load, i.e. accelerated release if phase drop-out occurs.

Other features of TI 80 and TI 86:

- stop/reset button
- manual/automatic reset
- test button
- double scale for direct start or Y/D start
- signal contact with changeover

Ordering

Thermal overload relays TI 80 and TI 86

Range		Max. fuse ¹⁾		Code no.	Type
Motor starter A	Y/D starter A	gl, gL, gG type 2 A	BS 88, type T type 2 A		
42-63	75-109	100	100	047H1016	TI 80
60-80	105-138	125	125	047H1017	TI 80
74-85	130-147	125	125	047H1018	TI 86

¹⁾ To IEC 947-4 coordination types 1 and 2:

Coordination type 1: Any type of damage to the motor starter is permissible. If the motor starter is in an enclosure, no external damage to the enclosure is permissible. After a short-circuit the thermal overload relay shall be partially or wholly replaced.

Coordination type 2: No damage to the motor starter is permissible, but slight contact burning and welding is permissible.

Selection of thermal overload relay

The selection of a thermal overload relay must be based on the motor full load current and the method of starting:

- With direct start the motor starter range applies.
- With star-delta start Y/D starter range applies.

Example:

Full load current: 85 A

-With direct start, the suitable motor starter range is 74-85 A, i.e. thermal overload relay 047H1018.

-With star-delta start, the suitable Y/D starter range is 75-109 A, i.e. thermal overload relay 047H1016.

Tripping graphs

TI 80 / 86

Explanation of graphs

Mean value curves

Upper curve: 3-phase tripping and asymmetric load tripping at min. setting.

Lower curve: Asymmetric load tripping at max. setting.

When tripping from the operationally warm condition, the tripping times are approx. 30% of the values shown. These values apply at an ambient temperature = 20°C.

$$\text{3-phase tripping: } x = \frac{\text{measured current}}{\text{rated motor current}}$$

$$\text{Asymmetric load tripping: } x = \frac{\text{measured current}}{\text{max. scale value on overload relay}}$$

Tripping time $2 < T_p \leq 10$ s at $7.2 \times I_e$ class 10 A

Note! In general, the thermal overload relay is always set on motor full load current.

3-phase overload

- 1) Measure overload current
- 2) Find the overload factor (x) by dividing the measured value by the set value of the thermal overload relay (motor full load current).
- 3) Find (x) on the horizontal axis and follow a line vertically up until it intersects the upper curve.
- 4) From the intersection point, follow a horizontal line to the left and read off on the vertical axis the time that will elapse before the thermal overload relay cuts out the motor.

Asymmetric load tripping

- 1) Measure the current the motor draws from one of the intact phases.
- 2) Find the overload factor (x) by dividing the measured value by the maximum scale value of the thermal overload relay.
- 3) Find (x) on the horizontal axis and follow a line vertically up until it intersects the lower curve.
- 4) From the intersection point, follow a horizontal line to the left and read off on the vertical axis the time that will elapse before the thermal overload relay switch off the motor.
